Change History

Version	Date	Description	
0.44	July 2000	Voted by members as appropriate for public release with modifications.	
0.90	August 2000	First version released to public.	
0.91	October 26, 2000	Remove chapters 1 & 2. Complete reformat	
0.92	4 November, 2000	Added new chapter for structures, updated functions to match IDL, editing changes.	
1.0 RC1	28 November 2000	incorporated comments cleaned up structures and made ready for publication.	
1.0 RC2	11 December 2000	Incorporated changes from reflector. Added new change authorization command.	
1.0 RC4	10 Jan 2001	Incorporated changes and fixed up IDL	
1.0 RC5	11 Jan 2001	PKCS#1 changes	
1.01	17 April 2001	Implemented corrections. Mid point save made to avoid problems with track changes in document	
1.02	18 April 2001	Continue with changes for 1.1 release, changed IDL to table format	
1.03		First attempt to reconcile IDL misses	
1.04	7 May 2001	Mid level drop to show all changes in regard to IDL	
1.06	17 May 2001	All CR's complete	
1.07	22 May 2001	Cleanup from WG messages and changing in Audit commands.	
1.1 RC1	25 May 2001	Release candidate for specification	
1.1 RC2	4 June 2001	All changes	
1.1 RC3	12 June 2001	Removal of TSS commands, cleanup of parameter blocks, all comments from v1 reflector.	
1.1 RC4	5 July 2001	Editing changes, candidate for final review	
1.1 RC6	17 July 2001	All changes made and version ready for voting	
1.1	31 July 2001	Voted on release of 1.1	
1.1a	12 th November 2001	Includes all errata upto and including #55

1. Forward

This document is an industry specification that enables trust in computing platforms in general.

This specification defines a trusted *Subsystem* that is an integral part of each platform, and provides functions that can be used by enhanced operating systems and applications. The Subsystem employs cryptographic methods when establishing trust, and while this does not in itself convert a platform into a secure computing environment, it is a significant step in that direction.

Standardization is necessary so that the security and cryptographic community can assess the mechanisms involved, and so that customers can understand and trust the effectiveness of new features. Manufacturers will compete in the marketplace by installing Subsystems with varying capabilities and cost points. The Subsystem itself will have basic functions that maintain privacy, yet support the identity and authentication of entities such as the platform, the user, and other entities. The Subsystem will have other capabilities to protect data and verify certain operational aspects of the platform. It can be a separate device or devices, or it can be integrated into some existing component or components provided the implementation meets the requirements of this specification. This is necessary to achieve the fundamental goal of ubiquity.

Please note a very important distinction between different sections of text throughout this document. Beginning in chapter 2, "The Trusted Platform Subsystem," you will encounter two distinctive kinds of text: informative comment and normative statements. Because most of the text in this specification will be of the kind normative statements, the authors have informally defined it as the default and, as such, have specifically called out text of the kind informative comment. They have done this by flagging the beginning and end of each informative comment and highlighting its text in gray. This means that unless text is specifically marked as of the kind informative comment, you can consider it of the kind normative statements.

The key words "MUST," "MUST NOT," "REQUIRED," "SHALL," "SHALL NOT," "SHOULD," "SHOULD NOT," "RECOMMENDED," "MAY," and "OPTIONAL" in the chapters 2-10 normative statements are to be interpreted as described in [RFC-2119].

For example:

This is the first pare riabano is entereigiable containing text of the kind intormative comment.

This is the second paregraph of text of the kind informative comment.

This is the into saragiable of text of the kind informative comment.

To understand the TOPA specification diseaser must read the specification. This associate to continue the interest of the specification.

This is the first paragraph of one or more paragraphs (and/or sections) containing the text of the kind normative statements ...

To understand the TCPA specification the user MUST read the specification. (This use of MUST indicates a keyword usage and requires an action).

2. The Trusted Platform Subsystem

2.1 Introduction

Stara of #informative comment-

Tipe TIGPA Subsystem cestign its to provide useful trust and security capabilities while minimizing the number of functions that must be trusted. This errangement is necessary to make the Subsystem useful white remaining flow in cost and real resultant unusual features as compared tylih acconventional copy to coppose so

Endrofilmformative comment

2.2 Roots of Trust

Start of informative comment

inns secilon introduces/the architectural ascess of a Trusted#Rlafform≤that enable the collection arc peroritherol integritymetrics

Among other things, a trusted Platform enables an entity to determine the state of the software environment in that platform end to SEAL deteros particular software environment in that platform.

The entity, deduces whether the state of the computing environment in that platform is acceptable and performs some transaction with that platform. If that transaction involves sensitive data that must be stored on the platform, the entity can ensure that that data is held in a confidential format unless the state of the computing environment in that platform is acceptable to the entity.

To enable this 'a Trusted Platform bioxides information to enable the entity to ideduce the software environmentum a Trusted Platform. That information is reliably measured and reported to the entity At the same time, a Trusted Platform provides a means to encrypt cryptographic keys and to state the software environment that trust be insplace before the keys can be decrypted.

Both these functions require sintegrity (metries - Prese metries consiste) 'data reflecting the untegrity of the software state of the Trusted Platform. Both functions require two foots of titus (in a platform. One is known as the free contrast to measure untegrity metries, and the other is known as the free of fusion storing and reporting integrity metries

The good of inest for measuring indeptly maines is alkely to be different for different types to relation is because the inverteem. The root of that for storing and the type of partiam. The root of that for storing and the control of the the cont

A insteadment from measurement of impassive schaling platform of materialistics, loop the measurement determine measurement store and stores the final result in a TRM (while reportants the root of trusts of stores of income and reporting integrity measurement. When-animedrity shallengesis received the FrusteeFPRiform Agent galness incribliowing

- MPIremianonicalheanalamienio
- and Ration of the measurement data from the Trusted Ration in Measurement Store and
- Tropy validation bata that states the values that the measurements should produce in a platform that also working correctly.

The Trusted Platform Agent then sends this measurement data to the Challenger. The Challenger uses the data to check that the Sconsistent with the final results and then compares the data (and perhaps the final results) with the JIGPA Validation Data : This comparison enables the Challenger to ideduce the

software state of the drusted Platform and consequently decide whether the Ghallenger is satisfied to irus the platform to the intended purpose.

ionestine Challenge drasoetermineddha dhe Trusteo Platform eandeitrusteo dhe Ghallenge dean usedhe 119MHe store kerselongste sialee values of integrity metres suchtha the 119M will not release the keys unless the concentrations ured values of integrity metre mater the stated values of integrity metre.

Both roots of kinest, plus derical other capabilities for other purposes, must be implemented in ways that enable confidence in their correct operation in all circumstances or interest. A Challenger must be able to institute roots and these espablities. The implementation of the foot of rust for measurement will typically vary depending on the type of platform (for example FC, server, or spone). The TPM is defined as the set of all trusted capabilities aparts room the root of trust for measurement, because these are independent of the type of platform. The whole Subsystem, therefore typically/consists of arroot of trust for measuring integrity, matrics follows TPM, tilts other tanglions the Support Services for SS) that do not have to be trusted to function property. Those other functions must still operate property liftine Subsystem is to operate property, but any misberavior of the SS can be detected.

ligs por the Intention of this is peditection to specify the method of construction of either the Subsystem of the TRM, provided that they inter the requirements of this specification. The following diagram is an indication of the functional elements of a typical TRM

End of informative comment

2.2.1 Definitions

Root of Trust for Measurement (RTM)

The point from which all trust in the measurement process is predicated. The RTM contains many components to provide this level of trust. The design document shows that the RTM includes a core component, the computing engine to run the core component, physical connections of the core and the computing engine and other items.

Core Root of Trust for Measurement (CRTM)

The component of the RTM from which the platform begins execution of its trusted state.

Root of Trust for Reporting (RTR)

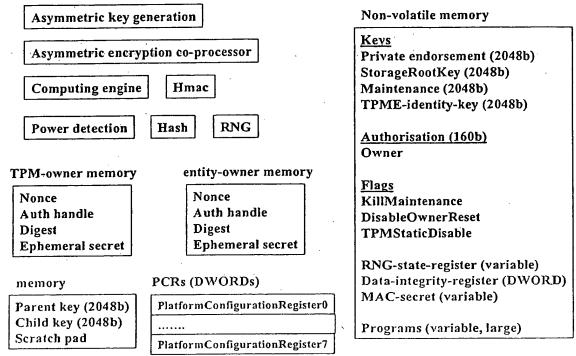

The point from which all trust in reporting of measured information is predicated.

Root of Trust for Storing (RTS)

The point from which all trust in Protected Storage is predicated.

2.2.2 Instantiations and Trust Bindings

TPM contents

A Trusted Platform SHALL include the following:

- at least one root of trust for measuring integrity metrics;
- exactly one root of trust for storing and reporting integrity metrics,
- · at least one Trusted Platform Measurement Store,
- at least one TCPA Validation Data, and
- exactly one Trusted Platform Agent.

The Endorsement Key is transitively bound to the Platform via the TPM as follows:

- 1. An Endorsement Key is bound to one and only one TPM (i.e., there is a one to one correspondence between an Endorsement Key and a TPM.)
- 2. A TPM is bound to one and only one Platform. (i.e., there is a one to one correspondence between a TPM and a Platform.)
- 3. Therefore, an Endorsement Key is bound to a Platform. (i.e., there is a one to one correspondence between an Endorsement Key and a Platform.)

An instantiation of the root of trust for measuring integrity metrics, while acting as the root of trust for measuring integrity metrics, SHALL do the following:

- execute no programs other than those intended by the entity that vouches for the root of trust for measuring integrity metrics,
- be resistant to the forms of software attack and to the forms of physical attack implied by the platform's Protection Profile,
- accurately measure at least one integrity metric that indicates the software environment of a platform,

- accurately record measured integrity metrics to a root of trust for storing and reporting integrity metrics, and
- accurately record details of the process of measuring all its integrity metrics to a Trusted Platform Measurement Store.

An instantiation of the root of trust for storing and reporting integrity metrics SHALL do the following:

- be resistant to all forms of software attack and to the forms of physical attack implied by the platform's Protection Profile,
- · accept recording of measured integrity metrics, and
- supply an accurate digest of all sequences of presented integrity metrics.

An instantiation of a Trusted Platform Measurement Store SHOULD do the following:

accurately accept, store and supply details of at least one process of measuring an integrity metric.

An instantiation of the repository for TCPA Validation Data SHOULD do the following:

accurately store and supply a predicted value of at least one integrity metric.

An instantiation of the Trusted Platform Agent SHOULD do the following:

- obtain and supply an accurate report from the root of trust for storing and reporting integrity metrics of at least one sequence of integrity metrics in a form that prevents misrepresentation of that sequence or its source.
- obtain and supply an accurate report from a Trusted Platform Measurement Store of at least one set
 of details describing the measurement of an integrity metric, and
- obtain and supply an accurate report from the repository for TCPA Validation Data of at least one predicted value of an integrity metric

2.3 Integrity Operations

2.3.1 Storage of Integrity Metrics

Seried informative comment

This sealon introduces the way that sequences of values of sintegrity matrics are stored in APIV. This sealon introduces are stored in the Trusted Patric Comment of Security and Security of the Way that Moss of the Measutement process are stored in the Trusted Patrionn Westurement Store

Each court in the log tipsic the Trusted Plattern Measurement Store contains a description of a measured entity jous an appropriate integrity matricipal as been recorded uside a TPM. The large and be used to recorded in side a TPM. The large and be used to recorded in side a TPM. The large and be used to recorded in side a TPM. The large and be used to recorded in side a TPM. The large and be used to recorded in side a TPM. The large and the TPM are the same, the log and used if the values derived from the log and the values reported by the TPM are the same, the log is presumed to be an accurate record of the sleps involved in building these fivered environment of the target platform. Consequently, the descriptions will be so the measured entities represent the actual entities that contributed to the software environment inside the platform. Any difference between the values derived from the log and the values reported by the TPM and cate an undestrable anconsistency in the state of the ranget platform:

The mechanism used by the TRM to store sequences to values of integrity metrics is the subject of this section affine the subject of this section affine the following the consistency of the values derived from the section affine values reported by the TRM togrand the values reported by the TRM.

Adarge intimater of integrity matries may be measured in a platform and a particular integrity metric may grange with time and at may value may meed to be stored it is difficult to anthenteate the source of grange with time and at may value may meed to be stored it is difficult to anthente cannot be permitted to measurement of differential matrices are suit a new value or an integrity metric cannot be permitted to measurement of differential matrices are suit of each and cannot be permitted to simply exercition and existing value. At togue sould energy an integrity metrics are inclived ally stored, and uppered out to a legitly metrics are inclived in the size to smemory integrity metrics must be inclived ally stored. The size to smemory integrity metrics are inclived integrity metrics.

Tipe TGPA solution is not to store individual fixed by method instead to fixisted Planomprovices away to store solution is not to store individual fixed by method cannot be stored finding at IPM, and to store sequences of integrity method cannot be sequenced in a sequence of the states of all sequences inside a IPM are set to a know must instead be appended to a sequence of the sequence and must modify the value value of the security method is to correct entering value of a new integrity method is to correct entering value of the security method is to correct entering value of the security method is to correct entering value of the security method is to correct entering value of the security method is to correct entering value of the security.

This method enables one or more sequences to represent an arbitrary number of integrity methods and their updates. The fewer the number of sequences, the more difficult it becomes to interpret the meaning of the value of a sequence. The greater the number of sequences, the more costly it becomes to provide of the value of a sequence. The greater the number of sequences, the more costly it becomes to provide of the value of a sequence. The greater the number of sequences, the more costly it becomes to provide of the value of a sequence are not provided in the context of the cost and difficulty of interpretation storage. A sparticular implementation must make a trade-off between cost and difficulty of interpretation.

End of informative comments

Integrity metrics that are presented to a TPM SHALL be stored inside that TPM in a way that prevents misrepresentation of the presented values or of the sequence in which they were presented.

2.3.2 Reporting of Integrity Metrics

Star of informative comment

Sequences of integrity metrics reported by the TPM SHALL be reported by that TPM in a way that prevents misrepresentation of the sequences and prevents misrepresentation of the reporting TPM

2.4 Use of Keys Associated with TPM Identities

ilinė privalė key assonalė villina irėm denilių is usei only io signalinės. Suar signalinės deni Gradibilitytosigned alia, bagauserinėmiai musi haya išan signadijo a 1720

Tine private kays associated with TPM identifies must be indellar stored with files that mark them as belogging to TPPM identifies in order that they can be distinguished from collectivities to trays. Tims is necessary to enforce restrictions obtained se of those revs.

IPM identifies can be used to sign certain date, and a TPM must refuse to use private keys associated with TPM identifies for other purposes. Otherwise rangue may construct data (outside the TPM), that has the same formal as that used by the TPM for special operations and cause a TPM idesign that data using a private key associated with TPM identify. Such data would be misinterpreted as genuine data constructed by the TPM for those special purposes, and could subvertifie trust in those special purposes thing TPM prevents such a masquerade, a third, party can always be certain that data (signed by a private key associated with a TRM identify) was actually generated by a TPM for one of hose special operations.

End/of informative comment

It MUST be possible to reliably distinguish between the private key of a TPM identity and other keys.

A key that is distinguished as the private key of a TPM identity SHALL NOT be used to generate a digital signature value over data that could mimic the output of a TCPA protected capability.

A TPM SHALL NOT use a key that is distinguished as the private key of a TPM identity except during the part of a TCPA "protected capability" whose specification permits and/or requires the use of a TPM identity.

When signing on behalf of a TPM identity during the part of a TCPA protected capability whose specification requires the signature of a TPM identity, a TPM SHALL NOT use a key other than one that is distinguished as the private key of a TPM identity.

2.5 Cryptographic Operations

Star oknjomative comment:

Tible section litticologis (i.e. use di exyplographie operations wildin the subsystem (Note that this specification does not include the ALS Title probable however that intuic versions of this specification with notice the ALS.

The Subsystem employs conventional cayptographic operations in conventional ways. Those operations include the following:

Hashine (SHA-1)

Random number generation (RNG)

Asymmetric key generation (RSA):

- Asymmetric encryption/decryption/(RSA)
- Symmetric encryption/decryption (3DES).

The Subsystem uses these constabilities to reprove contentation of tention tests generation of asymmetric are symmetric tests. Signing and confidentiality of storag tests. The Subsystem also uses confidential messaging for the coverage symmetric confidential messaging for the coverage symmetric confidentiality service. This choice is deliberate, because the fundamental TCPA objective is to improve this wind general purpose computing plantors. Herefore, TCPA objects only those functions that are necessary to improve confidence in size of pations as that processing final ling conventional security functions) of the special conventional security functions.

2.6.2 Activating a TPM

Start of informative comment:

il is desirable to provide inclinous that addivate or deaduvate at TPM ivilhout permanently preventing access to secrets produced by the TPM The grovision of deadlvation spelrous exposes he demaked service attack to distributions seems to demake service attack to distributions.

One method should certainly be the use of commands authorized by the Owner. This method has the abyan age that disproves reasested or stiffer nearly lags, and can be used alther locally or remotely A dispression of stiffer must grobably, be fully active in order to communicate an authorized command to a TRM. The concern is that the TRM may inactive tently be used received the pation is command to a TRM. The concern is that the TRM may inactive tently be used received the pation is command. The used received the TRM and the command deing received by the TRM another disadvantage is that there is necessary to disable a TRM when the Owner is not available of the majorist are therefore also required. The score of these methods must reflect any uncertainty appropressession of stiffer a priviled.

One method is required to control editors the platform is tully active. In these directristances if frey be difficult to reneak sufficingations of he method adopted to AFCPA. Is to use software controls that are purposely increasable offices are distinguished a local activation only (naturamote activation) fould its depends upon the degree to which the control software is actually, increasable to remain emittes.

Anolnar mathod is to reculted to operate when sine platform is fully addice but without. Owner authorization The method adopted by the TOPA is to use an unauthorized adminated that has a limited direct—it can be used just to dead valer TPM, and the aliest as son vurifitue platform is repocled

The method of final resort to activate a TRM is to use a physical (electrical) input to the TRM that cannot be controlled by software executing on the main platform withis method, (coviously) provides llocal activation but not remote activation. This method is useful if no one pastake nownership, or the Owners attion has been lost, but one or more User authorization that are still known the latter case. The TRM can be activated and Users can use their secrets to recover as much as possible of their data.

This specification uses four methods of activation (while retaining current fight secrets)

- A prvsical (electrical) inpute to the MPM that cannot be controlled by software executing on the main plainers. Exacting this physical input could prolive opening of the plainors and throwing a switch control causes attansion activate evential activation of an inpute allock ator example, each use of the control causes attansion activate evential that IPM ANIS (obviously) provides local activation but not remote activation.
- 2. An authenteaccamhane to the TPN from the Owner. This provides either local or remote entration on herry.
- s). The use of **soli**mar controls that are gamoidy intovasable. These are intended to provide that a supply a supply of solidations of the supply of solidations of the supply of the su

3. Protection

3.1 Introduction

Stant of informative comment

Hip: Protection Profile in the Conformance part of the specification (defines the threats that are resisted to a platform. This section, Refored of Locaribes the properties of selected capabilities and selected data locations within a platform that has a Protection Profile and has not been modified by playsled means.

This section introduces the concept of protected capabilities and the concept of shipline foretions to date: Jevery definition of a TCPA republity states whether it is a protected applicity. Date cerimitors spate whether the date mas be able in shipline foodings.

- o Appolected capability is one whose correct coefficients in acessity in order to the operation of the Subsystem to be trusted
- o Asmeljes Acealor is an area where data is protested agains and religion and nowing the electric in a significant

This specification lises the concept of protected responsibles so as to distinguish those. Subsistent capabilities that must be trustworthy. This in the Subsystem capabilities critically on the concern capabilities. Subsystem capabilities that are not protected, dapabilities must (of course) work protected in Subsystem is our course.

This specification uses the conception shielded locations, rather than the concept of shielded data. While the concept of shielded data is intuitive, it is extraordinarily difficult to define because of the imprecise meaning to the word data. For example, consider data that is produced in a safe location and then moved into ordinary storage it is the same data in both locations, but in one it is shielded data and in the other this not. Also, data may not always exist in the same form. For example, it may exist as vulnerable plaintext, but also may, sometimes be transformed into a locically protected form. This data continues to exist, but doesn't always need to be shielded data, the vulnerable form needs to be shielded data, the vulnerable form needs to be shielded data, but the logically, protected form does not it a specific form of data requires, protection against interference or paying it is therefore necessary to say, diring data D exists it must exist only in a shielded location more consist expression is the data to must be examinated as a fine data of the consist expression is the data to must be examinated.

Henry livius in the Subsystem depends of the ly on recess to cerein that the defendable be extent of ly that single content is a local provided by the content of the content of the content of the conversion tusing a protected expendity into arother the state are unless the other care are unless the other care are was defined as one that must be uple the example the local position, it is a few the field in a single content to the single content is a field in a single content.

Mas design and turplementation of a glationm determines the extention which the splatform (addiction subversion or espablities and data within Alich platform, Leistrecessary to define the attacks that must be passed by 1907/4-sinal decilorations and 1907/4-sprotected capabilities first had platform.

The TPM Protection Profile defines all attacks that are resisted by the TPM. These rated is must be considered when determining whether the integrity of TGPA-protected capabilities and data in TGPA-shielded locations can be damaged. These ratecks must be considered when determining whether there is a backdoor method of obtaining access to TGPA-protected capabilities and data in TGPA-shielded locations. These ratecks must be considered when determining whether TGPA-protected capabilities have made straightering.

For the purposes of the "Protection" section of the specification; the threats that MUST be considered when determining whether the platform facilitates subversion of TCPA-protected capabilities or data in TCPA-shielded locations SHALL include the methods inherent in physical attacks that should fail if the platform complies with its protection profile, and SHALL include all methods that require execution of instructions in a computing engine in the platform.

3.3 Integrity

Stancor informative comment:

A TOPA protected capability must be used to modify TOPA protected capabilities of televia modal statements of the material particles of the modified of the methods must not be allowed to material TOPA protected capabilities and taken in TOPA shielded locations. Otherwise, the linearity of TOPA protected capabilities and taken in TOPA shielded locations with the content of the shielded locations is unknown.

End⊧of informative comment ≥

A platform SHALL NOT facilitate the alteration of TCPA-protected capabilities or data in TCPA-shielded locations, except by TCPA-protected capabilities.

3.4 Privileged Access

Start of informative comment

Only TCPAsprotected capabilities are allowed to use the data in tCPA shielded locations. Otherwise togue can pretend to be a TCPA entity.

End of informative comment

A platform SHALL NOT facilitate the disclosure or the exposure of data in TCPA-shielded locations, except to TCPA-protected capabilities.

3.5 Side effects

Stant of informative comments

An implementation of a TGPA-protected expaiding must not disclose the contents of TGPA-shielded locations. The only exceptions are when such disclosure is interept to the cettabliton of the cettablity of the matheas tused by the cettablity. For example, a capability information designed specifically to reveal hidden said of might use only located by and hence always do without black cappilency in such cases some disclosure of tisk of disclosure its interent and cannot be avoided. Other torms of also osters to year of tisk of disclosure its interent and cannot be avoided.

End of informative comment

The implementation of a TCPA-protected capability in a platform SHALL NOT facilitate the disclosure or the exposure of data in TCPA-shielded locations except by means unavoidably inherent in the TCPA definition.

書書の大田の地

4. Structures and Defines

Start of informative comments

Tipe to lowing structures and normals, describe the lineroperable areas of the specification. There is no requirement that thiernal storage or memory representations of data must follow these structures. These requirements are the place only during the movement of data from a TRM to some other entity.

End of informative comments.

4.1.1 Endness of Structures

Each structure MUST use big endian bit ordering, which follows the Internet standard and requires that the low-order bit appear to the far right of a word, buffer, wire format, or other area and the high-order bit appear to the far left.

4.1.2 Byte Packing

All structures MUST be packed on a byte boundary.

4.1.3 Lengths

The "Byte" is the unit of length when the length of a parameter is specified.

4.2 Defines

Stant of informative comment:
The defines are found in scoal defines in

Endrol informative comment

4.2.1 Basic data types

Parameters

Typedef	Name	Description
unsigned char	BYTE	Basic byte used to transmit all character fields.
unsigned char	BOOL	TRUE/FALSE field. TRUE = 0x01, FALSE = 0x00
unsigned short	UINT16	16 bit field. The definition in different architectures may need to specify 16 bits instead of the short definition
unsigned long	UINT32	32 bit field. The definition in different architectures may need to specify 32 bits instead of the long definition

4.2.2 Boolean types

Name	Value	Description Description
TRUE	0x01	Assertion
FALSE	0x00	Contradiction

4.2.3 Helper redefinitions

The following definitions are to make the IDL definitions more explicit and easier to read.

Parameters

Typedef	Name .	Description
UINT32	TCPA_PCRINDEX	Index to a PCR register
UINT32	TCPA_DIRINDEX	Index to a DIR register
UINT32	TCPA_AUTHHANDLE	Handle to an authorization session
UINT32	TSS_HASHHANDLE	Handle to a hash session
UINT32	TSS_HMACHHANDLE	Handle to a HMAC session
UINT32	TCPA_ENCHANDLE	Handle to a encryption/decryption session
UINT32	TCPA_KEY_HANDLE	The area where a key is held assigned by the TPM.
UINT32	TCPA_RESULT	The return code from a function

4.2.4 Enumerated Helper redefinitions

Typedef	Name	Description	
UINT32	TCPA_COMMAND_CODE	The command ordinal. See 4.33

identifiacen:	
Endlolanformalixe.comment	

The following defines allow for the quick specification of a vendor specific item.

Parameters

Name	Value	
TCPA_Vendor_Specific32	0x80000000	-
TCPA_Vendor_Specific16	0x8000	
TCPA_Vendor_Specific8	0x80	

4.3 Return codes

Stanco/ក្រាសការដល់មន្ត១៣៣ម៉ាំដ

inhe treM nashiwe iyoes elarelums TGPA SUGGESS where the 非PM reports the results of a successio lungton execution and the fallure return

ilige (allure case only, returns a more autheniticated fixed setro); information, This is due to the fact that the failure may bave been due to authentication for biner factors and there is no possibility of producing an authenticated response

Falluras also terminate any authorization sessions. ⁹This is a result of returning only the e**r**or code as there is no way io return and continue the noncels necessary to maintain an authorization session.

l∃nd∤ofinformative comment.

Description

When a command fails for ANY reason, the TPM MUST return only the following three items:

- TPM_TAG_RQU_COMMAND (2 bytes)
- ParamLength(4 bytes, fixed at 10)
- Return Code (4 bytes, never TCPA_SUCCESS)

If a return code is mandated by the action list of a command the TPM MUST return that error code. All commands MAY return TPM_FAIL, where there is a more descriptive error code the TPM SHOULD use the more descriptive error code.

The return code MUST be chosen from the following list.

Parameters

Name	Value	Description
TCPA_BASE	0×0	The start of TCPA return codes
TCPA_SUCCESS	TCPA_BASE	Successful completion of the operation
TCPA_VENDOR_ERROR	TCPA_BASE + TCPA_Vendor_Spec ific32	These error codes are vendor specific for vendor specific commands.
TCPA_AUTHFAIL	TCPA_BASE + 1	Authentication failed
TCPA_BADINDEX	TCPA_BASE + 2	The index to a PCR, DIR or other register is incorrect
TCPA_BAD_PARAMETER	TCPA_BASE + 3	One or more parameter is bad
TCPA_AUDITFAILURE	TCPA_BASE + 4	An operation completed successfully but the auditing of that operation failed.
TCPA_CLEAR_DISABLED	TCPA_BASE + 5	The clear disable flag is set and all clear operations now require physical access
TCPA_DEACTIVATED	TCPA_BASE + 6	The TPM is deactivated
TCPA_DISABLED	TCPA_BASE + 7	The TPM is disabled
TCPA_DISABLED_CMD	TCPA_BASE + 8	The target command has been disabled
TCPA_FAIL	TCPA_BASE + 9	The operation failed
TCPA_INACTIVE	TCPA_BASE + 10	The TPM is inactive

TCPA_INSTALL_DISABLED	TCPA_BASE + 11	The ability to install an owner is disabled	
TCPA_INVALID_KEYHANDL	TCPA_BASE + 12	The key handle presented was invalid	
TCPA_KEYNOTFOUND	TCPA_BASE + 13	The target key was not found	
TCPA_NEED_SELFTEST	TCPA_BASE + 14	The capability requires an untested function; additional self-test is required before the capability may execute.	
TCPA_MIGRATEFAIL	TCPA_BASE + 15	Migration authorization failed	
TCPA_NO_PCR_INFO	TCPA_BASE + 16	A list of PCR values was not supplied	
TCPA_NOSPACE	TCPA_BASE + 17	No room to load key.	
TCPA_NOSRK	TCPA_BASE + 18	There is no SRK set	
TCPA_NOTSEALED_BLOB	TCPA_BASE + 19	An encrypted blob is invalid or was not created by this TPM	
TCPA_OWNER_SET	TCPA_BASE + 20	There is already an Owner	
TCPA_RESOURCES	TCPA_BASE + 21	The TPM has insufficient internal resources to perform the requested action.	
TCPA_SHORTRANDOM	TCPA_BASE + 22	A random string was too short	
TCPA_SIZE	TCPA_BASE + 23	The TPM does not have the space to perform the operation.	
TCPA_WRONGPCRVAL	TCPA_BASE + 24	The named PCR value does not match the current PCR value.	
TCPA_BUSY	TCPA_BASE + 25	The TPM is too busy to respond to the command	
TCPA_SHA_THREAD	TCPA_BASE + 26	There is no existing SHA-1 thread.	
TCPA_SHA_ERROR	TCPA_BASE + 27	The calculation is unable to proceed because the existing SHA-1 thread has already encountered an error.	
TCPA_FAILEDSELFTEST	TCPA_BASE + 28	Self-test has failed and the TPM has shutdown.	
TCPA_AUTH2FAIL	TCPA_BASE + 29	The authorization for the second-key in a 2 key function failed authorization	
TCPA_BADTAG	TCPA_BASE + 30	The tag value sent to for a command is invalid	
TCPA_IOERROR	TCPA_BASE + 31	An IO error occurred transmitting information to the TPM	
TCPA_ENCRYPT_ERROR	TCPA_BASE + 32	The encryption process had a problem.	
TCPA_DECRYPT_ERROR	TCPA_BASE + 33	The decryption process did not complete.	
TCPA_INVALID_AUTHHAND LE	TCPA_BASE + 34	The auth handle was invalid	
TCPA_NO_ENDORSEMENT	TCPA_BASE + 35	The TPM does not a EK installed	
TCPA_INVALID_KEYUSAGE	TCPA_BASE + 36	The usage of a key is not allowed	
TCPA_WRONG_ENTITYTYPE	TCPA_BASE + 37	The submitted entity type is not allowed	
TCPA_INVALID_POSTINIT	TCPA_BASE + 38	The command was received in the wrong

4.4 Command Specification Table Description

4.4.1 Introduction, Definition of Terms

- The parameter order column (*PARAM*) lists the order in which the parameters must be added to the input or output array and their respective size. If this entry in the column is blank, then that parameter is not sent to the TPM driver.
- <> in size column means that the size of the element is defined by the appropriate input parameter (sizeInData controls inData). Where an explicit input 'size' parameter exists, it has been moved to immediately precede the array to which it refers so that there is no confusion.
- When a null terminated string is included in a calculation, the terminating null SHALL NOT be included in the calculation.
- The following rules concerning byte ordering within a parameter are consistent with Section 4.1 and follow Internet standards:
 - 1. Elements of a structure are marshaled in the order in which they appear in the document.
 - 2. Byte arrays are marshaled starting with index 0, followed by index 1, and so on.
 - 3. Integer types are marshaled most significant byte first.
 - 4. No padding bytes are to be inserted at any point.
 - 5. Bit ordering within the byte is determined by the IO channel in use.
- Parameters are marshaled into the input or output arrays according to the following order:
 - 1. Tag specifier
 - 2. Array length, including tag and length specifier bytes
 - 3. Command ordinal and/or return code
 - 4. Key handles
 - 5. Remaining fixed length parameters
 - 6. Remaining variable length parameters (with their size parameter)
 - 7. If applicable, First authorization setup (authHandle input only, then nonce, then continueUse)
 - 8. If applicable, First Authorization digest
 - 9. If applicable, Second authorization setup
 - 10. If applicable, Second authorization digest

4.4.2 HMAC Calculation for Authorization

- All authorized parameters other than the authorization setup parameters (authHandle, nonces and continueUse) are hashed using SHA-1. This digest, referred to as <paramDigest> throughout this document, is HMAC'd with the authorization setup parameters to form the authorization digest.
- Where there are two authorization sessions within a single command (changeAuth, etc.) the two HMACs are computed using the common paramDigest but their respective setup parameters only.
 - AuthDigest1 = HMAC(<paramDigest>, EvenNonce1, OddNonce1, continueUse1)
 - 2. AuthDigest2 = HMAC(<paramDigest>, EvenNonce2, OddNonce2, continueUse2)
- The comment after the HMAC authorization digest includes the source of the HMAC key for the digest. If the authorization session is of type OSAP, then the actual key is the sharedSecret that was

- derived from the secret listed in the comment. For OIAP sessions, the HMAC key is the listed secret directly.
- Note that as the first element to the HMAC calculation is <paramDigest>, HMAC element numbers start with 2 in all cases below.
- In all cases, both input and output, the HMAC calculation uses the following order:
 - 1. <paramDigest>
 - 2. Even nonce (generated by TPM)
 - 3. Odd nonce (generated by system)
 - 4. ContinueUse

4.4.3 Parameter List Tag Identifiers

Tag	Name	Description
0x00C1	TPM_TAG_RQU_COMMAND	A command with no authentication.
0x00C2	TPM_TAG_RQU_AUTH1_COMMAND	An authenticated command with one authentication handle
0x00C3	TPM_TAG_RQU_AUTH2_COMMAND	An authenticated command with two authentication handles
0x00C4	TPM_TAG_RSP_COMMAND	A response from a command with no authentication
0x00C5	TPM_TAG_RSP_AUTH1_COMMAND	An authenticated response with one authentication handle
0x00C6	TPM_TAG_RSP_AUTH2_COMMAND	An authenticated response with two authentication handles

4.5 TCPA_VERSION

```
Start of informative comment.
The TCPA=VERSION allows the TPM to communicate with outside entities as to the version of the TRM.
This structure is set by the TPM and included in structures that are maintained long term outside of the TRM.
TRM.
Endrof informative comment
```

IDL Definition

```
typedef struct tdTCPA_VERSION {
  BYTE major;
  BYTE minor;
  BYTE revMajor;
  BYTE revMinor;
} TCPA_VERSION;
```

Parameters

Туре	Name	Description
BYTE	major	This SHALL be the major version indicator. For version 1 this MUST be 0x01
BYTE	minor	This SHALL be the minor version indicator. For version 1 this MUST be 0x01
BYTE	revMajor	This SHALL be the value of the TCPA_PERSISTENT_DATA -> revMajor
BYTE	revMinor	This SHALL be the value of the TCPA_PERSISTENT_DATA -> revMinor

Descriptions

The version points to the version of the specification that defines the structure.

If the validity of a structure depends on conformity to a version of the specification and/or to a version of the TPM, that structure SHALL include the current instance of TCPA_VERSION

4.6 TCPA_DIGEST

Star voluniomative comment. The digest value reports the result of artiesh operation in Version 100 of this specification the hash algorithm is SHALI with a resulting mash result being 160 bits. This lask of lexibility is because the size of a digestines a diametic effection the implementation of a hardware TRM. End of Uniformative comment.

Definition

```
typedef struct tdTCPA_DIGEST{
    BYTE digest[digestSize];
} TCPA DIGEST;
```

Parameters

Type	Name	Description
BYTE	digest	This SHALL be the actual digest information

Description

The digestSize parameter MUST indicate the block size of the algorithm and MUST be 20 or greater.

For all TCPA v1 hash operations, the hash algorithm MUST be SHA-1 and the digestSize parameter is therefore equal to 20.

Redefinitions

Typedef	Name	Description
TCPA_DIGEST	TCPA_PCRVALUE	The value inside of the PCR
TCPA_DIGEST	TCPA_COMPOSITE_HASH	This SHALL be the hash of a list of PCR indexes and PCR values that a key or data is bound to (See 10.4.5 for details)
TCPA_DIGEST	TCPA_DIRVALUE	This SHALL be the value of a DIR register
TCPA_DIGEST	TCPA_HMAC	
TCPA_DIGEST	TCPA_CHOSENID_HASH	This SHALL be the digest of the chosen identityLabel and privacyCA for a new TPM identity. See 10.4.6 for details.

4.7 TCPA_NONCE

Stanforinformative comment:
A honogrist arrandom value that provides protection from replay and other attacks. Many of the commands and protects in the specification require a mones, This structure provides at consistent wiew of what a noncest in the specification require a mones, This structure provides at consistent wiew of what a noncest.

End-of informative comment.

Definition

typedef struct tdTCPA_NONCE{
 BYTE nonce[20];
} TCPA_NONCE;

Туре	Name	Description
BYTE	nonce	This SHALL be the 20 bytes of random data. When created by the TPM the value MUST be the next 20 bytes from the RNG.

4.8 TCPA_AUTHDATA

Staricollinormative comment:

The authorization data is the differmation that is saved to passed to provide account account as in a contain of a Captily from varsion thins area is always 20 loyles

Tand of linformative comment

Definition

typedef BYTE IdTCPA_AUTHDATA[20];

Parameters

None.

Descriptions

When sending authorization data to the TPM the TPM does not validate the decryption of the data. It is the responsibility of the entity owner to validate that the authorization data was properly received by the TPM. This could be done by immediately attempting to open an authorization session.

The owner of the data can select any value for the data

Redefinitions

Typedef	Name	Description
TCPA_AUTHDATA	TCPA_SECRET	A secret plaintext value used in the authorization process.
TCPA_AUTHDATA	TCPA_ENCAUTH	A ciphertext (encrypted) version of authorization data. The encryption mechanism depends on the context.

4.9 TCPA_KEY_HANDLE_LIST

```
Statiofiniormativercomment.
TCPA: KEX: HYNDLE: LIST is a substitute used to describe the handles of all keys currently loaded into a
TPM: See:85 (15).
Lendrof informative comment.
```

IDL Definition

Parameters

Туре	Name	Description
UINT16	loaded	The number of keys currently loaded in the TPM.
UINT32	handle	An array of handles, one for each key currently loaded in the TPM

Description

The order in which keys are reported is manufacturer-specific.

4.10 TCPA_KEY_USAGE values

Ser comment

This value de incestre types of keys that are possible

Eacht key has a setting terifining the reneryption and storid the selection of asket usage value finitis the choices of eneryption and signature schemes Endrof informative comment

Name	Value	Description
TPM_KEY_SIGNING	0x0010	This SHALL indicate a signing key. The [private] key SHALL be used for signing operations, only. This means that it MUST be a leaf of the Protected Storage key hierarchy.
TPM_KEY_STORAGE	0×0011	This SHALL indicate a storage key. The key SHALL be used to wrap and unwrap other keys in the Protected Storage hierarchy, only.
TPM_KEY_IDENTITY	0x0012	This SHALL indicate an identity key. The key SHALL be used for operations that require a TPM identity, only.
TPM_KEY_AUTHCHANGE	0X0013	This SHALL indicate an ephemeral key that is in use during the ChangeAuthAsym process, only.
TPM_KEY_BIND	0×0014	This SHALL indicate a key that can be used for TPM_Bind and TPM_Unbind operations only.
TPM_KEY_LEGACY	0x0015	This SHALL indicate a key that can perform signing and binding operations. The key MAY be used for both signing and binding operations. The TPM_KEY_LEGACY key type is to allow for use by applications where both signing and encryption operations occur with the same key. The use of this key type is deprecated.

4.10.1 Mandatory Key Usage Schemes

Start of Informative Comment.
For a given key usage type there are subset of valid energition and signature schemes.
Endrol informative comment

The key usage value for a key determines the encryption and / or signature schemes which MUST be used with that key. The table below maps the schemes defined by this specification to the defined key usage values. See sections 8.4 and 8.5.

Name	Allowed Encryption schemes	Allowed Signature Schemes	
TPM_KEY_SIGNING	TCPA_ES_NONE	TCPA_SS_RSASSAPKCS1v15_SHA1	
		TCPA_SS_RSASSAPCKS1V15_DER	
TPM_KEY_STORAGE	TCPA_ES_RSAESOAEP_SHA1_MGF1	TCPA_SS_NONE	
TPM_KEY_IDENTITY	TCPA_ES_NONE	TCPA_SS_RSASSAPKCS1v15_SHA1	
TPM_KEY_AUTHCHANGE	TCPA_ES_RSAESOAEP_SHA1_MGF1	TCPA_SS_NONE	
TPM_KEY_BIND	TCPA_ES_RSAESOAEP_SHA1_MGF1	TCPA_SS_NONE	
	TCPA_ES_RSAESPKCSV15		
TPM_KEY_LEGACY	TCPA_ES_RSAESOAEP_SHA1_MGF.1	TCPA_SS_RSASSAPKCS1v15_SHA1	
	TCPA_ES_RSAESPKCSV15	TCPA_SS_RSASSAPKCS1V15_DER	

Where manufacturer specific schemes are used, the strength must be at least that listed in the above table for TPM_KEY_STORAGE, TPM_KEY_IDENTITY and TPM_KEY_AUTHCHANGE key types.

4.11 TCPA_AUTH_DATA_USAGE values

Standonnonnonne (comments) The only we options at this tilene are always or hever father versions fear allow for three complex decisions recarding authorization sheeking.

land of informative comment.

Name	Value	Description
TPM_AUTH_NEVER	0x00	This SHALL indicate that usage of the key without authorization is permitted.
TPM_AUTH_ALWAYS	0x01	This SHALL indicate that on each usage of the key the authorization MUST be performed.
·		All other values are reserved for future use.

volatileKey	0x00000004	This mask value SHALL indicate that the key MUST be unloaded upon execution of the TPM_Init/TPM_Startup sequence.

The value of TCPA_KEY_FLAGS MUST be decomposed into individual mask values. The presence of a mask value SHALL have the effect described in the above table

4.13 Flags and persistent data structures

ilnionnative comment

Tide: TRM mainteins riags in volatile and non-volatile areas. These flags indeate the status of TPMenabiling TPM-ownership and TRM-addivation. The TPM-also mainteins data in volatile and inon-volatile areas. Only centin dela area splined to be stored in non-volatile areas (other data *ma)*/ be stored in nonvolatile areas, but are not *required* to be stored in hous volatile areas).

The soling of financiaculies of his suitorization by the TRM. Overar or the assaulourouphysical presence at the politicum, the sature of assaulourouphysical presence is a many quarter operation. There are many methods for making the assaulourand metallications terms along the distincts. The underlying them is not provided the assaulourand metallications terms along the status of the TRM without culture and we also the status of the TRM without culture and we also the status of the TRM without culture and we also the status of the platform.

One mathod of providing the physical presence assemble is to thave the TPM accept communics ouring a period when the operation of the partions is constanted. In a PC, the mathod impin occase, suring the POST, and require inputationally uses via the textocard. The TPM would allow access to the command until execution of some which point and the POST process in order the TPM that it should no longer acception of some which point and the POST process in order the TPM that it should no longer accepting and the commands.

End of informative comment

4.13.1 TCPA persistent data

Informative comment Purely for the convenience of disting such data together, this sixuature contains the minimum set of TGPA data that are required to be persisted End to finite mative comment

IDL Definition

```
typedef struct tdTCPA_PERSISTENT_DATA{

BYTE revMajor;

BYTE revMinor;

TCPA_NONCE tpmProof;

TCPA_PUBKEY manuMaintPub;

TCPA_KEY endorsementKey;

TCPA_SECRET ownerAuth;

TCPA_KEY srk;

TCPA_DIRVALUE* dir;

BYTE* rngState;

BYTE ordinalAuditStatus;

TCPA_PERSISTENT_DATA;
```

Type

These data exist in TPM shielded-locations, only, and SHALL be non-volatile. Other TCPA data MAY be persistent, except when specifically prohibited (by an IsVolatile flag, for example).

Description

Types of Persistent Data

Туре	Name	Description
BYTE	revMajor	This is the TPM major revision indicator. This SHALL be set by the TPME, only. The default value is manufacturer-specific.
BYTE	révMinor	This is the TPM minor revision indicator. This SHALL be set by the TPME, only. The default value is manufacturer-specific.
TCPA_NONCE	tpmProof	This is a random number that each TPM maintains to validate blobs in the SEAL and other processes. The default value is manufacturer-specific.
TCPA_PUBKEY	manuMaintPub	This is the manufacturer's public key to use in the maintenance operations. The default value is manufacturer-specific.
TCPA_KEY	endorsementKey	This is the TPM's endorsement key pair. See 9.2. The default value is manufacturer-specific.
TCPA_SECRET	ownerAuth	This is the TPM-Owner's authorization data. See 5.11.1. The default value is manufacturer-specific.
TCPA_KEY	srk	This is the TPM's StorageRootKey. See 5.11.1. The default value is manufacturer-specific.
TCPA_DIRVALUE*	dir	These are the DataIntegrityRegisters. There MUST be at least one DIR. See, for example, 6.3.4. The default

		value of a DIR is zero.
BYTE*	rngState	State information describing the random number generator. The default state and subsequent states are described in 10.5.
BYTE[]	ordinalAuditStat us	Table indicating which ordinals are being audited. See section 8.12

4.13.2 TCPA_PERSISTENT_FLAGS Structure

Start of informative comment:

persistent/flags:allow/the TPM:tomaintaint/niemalistate/across-TPM:threcycles/ameserilags/not/ide liags to indicate activation status and physical presence recurrement

i inedogleal Oking of the impovare signal with the PhysiallyPresence riags allows the platform manufacturer to: Allowerther method to override the ather. Allow one method exclusively, On disallo, both-preventing the local commands from even executing.

End of Informative comment

```
typedef struct tdTCPA_PERSISTENT FLAGS{
      BOOL disable;
      BOOL ownership;
      BOOL deactivated;
      BOOL readPubek;
      BOOL disableOwnerClear;
      BOOL allowMaintenance;
      BOOL physicalPresenceLifetimeLock;
      BOOL physicalPresenceHWEnable;
      BOOL physicalPresenceCMDEnable;
      BOOL CEKPUsed;
} TCPA_PERSISTENT_FLAGS;
```

Type

TPM shielded location: These flags exist only in a TPM shielded-location and SHALL be non-volatile. Other flags MAY be persistent, except when specifically prohibited.

Type	Name	Description	
BOOL	disable	The state of the disable flag. See 8.14. The default state is TRUE	
BOOL	ownership	The ability to install an owner. See 8.12.5. The default state is TRUE.	
BOOL	deactivated	The state of the inactive flag. See 8.15. The default state is TRUE.	
BOOL	readPubek	The ability to read the PUBEK without owner authorization. See 9.2.2. The default state is TRUE.	
BOOL	disableOwnerClear	Whether the owner authorized clear commands are active. See 8.10.6. The default state is FALSE.	
BOOL	allowMaintenance	Whether the TPM Owner may create a maintenance archive. See 7.3.1. The default state is TRUE.	
BOOL	physicalPresenceLifetim eLock	This bit can only be set to TRUE; it cannot be set to FALSE except during the manufacturing process.	
		FALSE: The state of either physicalPresenceHWEnable or	

		physicalPresenceCMDEnable MAY be changed. (DEFAULT)
, commander a series of agents		TRUE: The state of either physicalPresenceHWEnable or physicalPresenceCMDEnable MUST NOT be changed for the life of the TPM.
BOOL	physicalPresenceHWEnabl e	FALSE: Disable the hardware signal indicating physical presence. (DEFAULT)
,		TRUE: Enables the hardware signal indicating physical presence.
BOOL	physicalPresenceCMDEnab le	FALSE: Disable the command indicating physical presence. (DEFAULT)
		TRUE: Enables the command indicating physical presence.
BOOL	CEKPUsed	TRUE: The PRIVEK and PUBEK were created using TPM_CreateEndorsementKeyPair.
		FALSE: The PRIVEK and PUBEK were created using a manufacturers process.
		NOTE: This flag has no default value as the key pair MUST be created by one or the other mechanism.

Description

The data structure TCPA_PERSISTENT_FLAGS SHALL exist in a TPM shielded-location, only, and SHALL be non-volatile.

The physicalPresenceHWEnable and physicalPresenceCMDEnable flags MUST mask their respective signals before further processing. The hardware signal, if enabled by the physicalPresenceHWEnable flag, MUST be logically ORed with the PhysicalPresence flag, if enabled, to obtain the final physical presence value used to allow or disallow local commands.

Actions

1. Disable flag

- a. If disable has the value of TRUE the following commands will execute with their normal protections
 - i. TPM_Reset
 - ii. TPM_Init
 - iii. TPM_Startup
 - iv. TPM_SaveState
 - v. TPM_SHA1Start
 - vi. TPM_SHA1Update
 - vii. TPM_SHA1Complete
 - viii. TPM_SHA1CompleteExtend
 - ix. TSC_PhysicalPresence
 - x. TPM_OIAP
 - xi. TPM_OSAP

- xii. TPM_GetCapability
- xiii. TPM_Extend
- xiv. TPM_OwnerSetDisable
- xv. TPM_PhysicalEnable
- xvi. TPM_ContinueSelfTest
- xvii. TPM_SelfTestFull
- xviii. TPM_GetTestResult
- b. All other commands SHALL return TCPA_DISABLED.

2. Ownership flag

a. If ownership has the value of FALSE, then any attempt to install an owner fails with the error value TCPA_INSTALL_DISABLED.

3. Deactivated flag

a. This flag sets the state of TCPA_VOLATILE_FLAGS -> deactivated upon initialization.

4. readPubek

a. If readPubek is TRUE then the TPM_ReadPubek will return the PUBEK, if FALSE the command will return TCPA_DISABLED_CMD.

5. DisableOwnerClear

a. If disableOwnerClear is TRUE then the clear commands requiring owner authorization will return TCPA_CLEAR_DISABLED, if false the commands will execute.

4.13.3 TCPA_VOLATILE_FLAGS Structure

Start of informative comment

Bespile (is name, the datastructure TGPA vol.AmilE FLAGS may be stored in horevolatile media. To do so may on may not be acvariageous, depending on arounstances (ILTOPA VOLAMEE FLAGS) is idelicum non volatile storage, the operation of TPM SaveStates sumplified.

nen lexical is monocautico lo operate when a TENAIS deastivated This is because a ideactivated TRM performs no usatil service untillambitorin is repooled, alcunor rountille RCRs are reserv

TRM 19aGapabiliy and TPM GreadEndoisamentkey may be valled before TRM Statup. This t hexassaty/because TRM Statub will fall unless arrendoisementke/exists

Uptaing audiologes: is unnecessary when a TAM is deadlyated. This is because a deadlyated TAM performs notusefulsarvice juidila filation risnebooted, at which bold the audiologes (isnese).

IDL Definition

```
typedef struct tdTCPA_VOLATILE_FLAGS{
    BOOL deactivated;
    BOOL disableForceClear;
    BOOL physicalPresence;
    BOOL physicalPresenceLock;
    BOOL postInitialise;
} TCPA_VOLATILE_FLAGS;
```

Type

TPM shielded location

Type	Name	Description
BOOL	deactivated	Prevents the operation of most capabilities. There is no default state. It is initialized by TPM_Startup to the same value as TCPA_PERSISTENT_FLAGS -> deactivated. TPM_SetTempDeactivated sets it to TRUE.
BOOL	disableForceClear	Prevents the operation of TPM_ForceClear when TRUE. The default state is FALSE. TPM_DisableForceClear sets it to TRUE.
BOOL	physicalPresence	Indicates that a User is physically present when TRUE. The default state is FALSE (User is not physically present)
BOOL	physicalPresenceLock	Indicates whether changes to the physicalPresence flag are permitted. TPM_Startup/ST_CLEAR sets PhysicalPresence to its default state of FALSE (allow changes to PhysicalPresence flag). The meaning of TRUE is: Do not allow further changes to PhysicalPresence flag. TSC_PhysicalPresence can change the state of physicalPresenceLock.
BOOL	postInitialise	Prevents the operation of most capabilities. There is no default state. It is initialized by TPM_Init to TRUE.

ı	
- 1	TPM_Startup sets it to FALSE.
- 1	I I FIVE Startup sets it to FALSE.
- 1	_ ,
•	

Description

The data structure TCPA_VOLATILE_FLAGS SHALL exist only in a TPM shielded-location.

The data structure TCPA_VOLATILE_FLAGS MAY be held in non-volatile storage.

Actions

1. Deactivated flag

- a. If deactivated is TRUE the following commands SHALL execute with their normal protections
 - i. TPM_Reset
 - ii. TPM_Init
 - iii. TPM_Startup
 - iv. TPM_SaveState
 - v. TPM_SHA1Start
 - vi. TPM_SHA1Update
 - vii. TPM_SHA1Complete
 - viii. TPM_SHA1CompleteExtend
 - ix. TSC_PhysicalPresence
 - x. TPM_OIAP
 - xi. TPM_OSAP
 - xii. TPM_GetCapability
 - xiii. TPM_TakeOwnership
 - xiv. TPM_OwnerSetDisable
 - xv. TPM_PhysicalDisable
 - xvi. TPM_PhysicalEnable
 - xvii. TPM_PhysicalSetDeactivated
 - xviii. TPM_ContinueSelfTest
 - xix. TPM_SelfTestFull
 - xx. TPM_GetTestResult
- b. All other commands SHALL return TCPA_DEACTIVATED.

2. DisableForceClear

If disableForceClear is TRUE then the TPM_ForceClear command returns TCPA_CLEAR_DISABLED, if FALSE then the command will execute.

3. PhysicalPresence

If physicalPresence is TRUE and TCPA_PERSISTENT_FLAGS -> physicalPresenceCMDEnable is TRUE, the TPM MAY assume that the Owner is physically present. If physicalPresence is FALSE, the TPM MUST assume that the Owner is physically absent. Note that this physicalPresence is exclusive of the unambiguous physical presence indication required for TPM_PhysicalEnable. They MAY be the same hardware signal depending on the design of the platform and TPM.

4. physicalPresenceLock

If physicalPresenceLock is TRUE, TSC_PhysicalPresence MUST NOT change the physicalPresence flag. If physicalPresenceLock is FALSE, TSC_PhysicalPresence will operate.

5. postinitialise

- a. If postInitialise is TRUE the following commands SHALL execute with their normal protections:
 - i. TPM_Startup
 - ii. TPM_CreateEndorsementKey
 - iii. TPM_GetCapability
 - iv. TPM_ContinueSelfTest
 - v. TPM_SelfTestFull
 - vi. TPM_GetTestResult
- All other commands SHALL set the flag TCPA_VOLATILE_FLAGS -> postInitialise to FALSE, set TCPA_VOLATILE_FLAGS -> deactivated to TRUE, and return TCPA_INVALID_POSTINIT

4.14 TCPA_PAYLOAD_TYPE

Stantofrimormative comment
This structure is pedifies the type of payload in various messages
Endiofrintormative comment

Definition

typedef unsigned char TCPA_PAYLOAD_TYPE;

TCPA_PAYLOAD_TYPE Values

Value	Name	Comments
0×01	TCPA_PT_ASYM	The entity is an asymmetric key
0x02	TCPA_PT_BIND	The entity is bound data
0×03	TCPA_PT_MIGRATE	The entity is a migration blob
0x04	TCPA_PT_MAINT	The entity is a maintenance blob
0x05	TCPA_PT_SEAL	The entity is sealed data
0x06 - 0x7F		Reserved for future use by TCPA
0x80 - 0xFF		Vendor specific payloads

4.15 TCPA_ENTITY_TYPE

StancoFiniormative comment
This specifies the types of entity transite supported by the TPM
End-of informative comment:

TCPA_ENTITY_TYPE Values

Value	Event Name	Comments	
0x0001	TCPA_ET_KEYHANDLE	The entity is a keyHandle	
0x0002	TCPA_ET_OWNER	The entity is the TPM Owner	
0x0003	TCPA_ET_DATA	The entity is some data	
0x0004	TCPA_ET_SRK	The entity is the SRK	
0x0005	TCPA_ET_KEY	The entity is a key	

Description

For the entity type of TCPA_ET_OWNER the associated key handle MUST be 0x40000001 For the entity type of TCPA_ET_SRK the associated key handle MUST be 0x40000000

4.16 TCPA_STARTUP_TYPE

Starkot informativercomment: To specify what type of startup is occurring End-olanformative comments

TCPA_STARTUP_TYPE Values

Value	Event Name	Comments
0x0001	TCPA_ST_CLEAR	The TPM is starting up from a clean state
0x0002	TCPA_ST_STATE	The TPM is starting up from a saved state
0x0003	TCPA_ST_DEACTIVATED	The TPM is to startup and set the deactivated flag to TRUE

4.18 TCPA_ALGORITHM_ID

Starkofinformative:comment

This table defines the types of algorithms which may be supported by the TIPM?

End of Informative;comment

Definition

TCPA_ALGORITHM_ID values

Name	Value	Description	
TCPA_ALG_RSA	0x0000001	The RSA algorithm.	···-
TCPA_ALG_DES	0x00000002	The DES algorithm	
TCPA_ALG_3DES	0X00000003	The 3DES algorithm	
TCPA_ALG_SHA	0×00000004	The SHA1 algorithm	
TCPA_ALG_HMAC	0×00000005	The RFC 2104 HMAC algorithm	
TCPA_ALG_AES	0×00000006	The AES algorithm	

The TPM MUST support the algorithms TCPA_ALG_RSA, TCPA_ALG_SHA, TCPA_ALG_HMAC.

4.19 TCPA_PHYSICAL_PRESENCE

Name	Value	Description
TCPA_PHYSICAL_PRESENCE_LIFETIME_L OCK	0x0080h	Sets the physicalPresenceLifetimeLock to TRUE
TCPA_PHYSICAL_PRESENCE_HW_ENABLE	0x0040h	Sets the physicalPresenceHWEnable to TRUE
TCPA_PHYSICAL_PRESENCE_CMD_ENABLE	0×0020h	Sets the physicalPresenceCMDEnable to TRUE
TCPA_PHYSICAL_PRESENCE_NOTPRESENT	0x0010h	Sets PhysicalPresence = FALSE
TCPA_PHYSICAL_PRESENCE_PRESENT	0×0008h	Sets PhysicalPresence = TRUE
TCPA_PHYSICAL_PRESENCE_LOCK	0x0004h	Sets PhysicalPresenceLock = TRUE

4.20 TCPA_KEY_PARMS

Start of informative comment ::

This provides a standard mechanism to define like parameters used to generate a key pair, and to stor the parts of a keysshared between the roublic and private key parts.

End of informative comment

Definition

```
typedef struct tdTCPA_KEY_PARMS {
    TCPA_ALGORITHM_ID algorithmID;
    TCPA_ENC_SCHEME encScheme;
    TCPA_SIG_SCHEME sigScheme;
    UINT32 parmSize;
    [size_is(parmSize)] BYTE* parms;
} TCPA_KEY_PARMS;
```

Parameters

Туре	Name	Description
TCPA_ALGORITHM_ID	algorithmID	This SHALL be the key algorithm in use
UINT32	parmSize	This SHALL be the size of the parms field in bytes
TCPA_ENC_SCHEME	encScheme	This SHALL be the encryption scheme that the key uses to encrypt information see section 8.4
TCPA_SIG_SCHEME	sigScheme	This SHALL be the signature scheme that the key uses to perform digital signatures see section 8.5
BYTED	parms	This SHALL be the parameter information dependant upon the key algorithm.

Descriptions

The contents of the 'parms' field will vary depending upon algorithmId:

Algorithm Id	PARMS Contents
TCPA_ALG_RSA	A structure of type TCPA_RSA_KEY_PARMS
TCPA_ALG_DES	No content
TCPA_ALG_3DES	No content – Need description of key size (3 full keys etc) and mode EDE etc.
TCPA_ALG_SHA	No content
TCPA_ALG_HMAC	No content
TCPA_ALG_AES	No content – Need description of key size (128, 192, 256)

4.20.1 TCPA_RSA_KEY_PARMS

```
Stant of informative comment:
This structure describes the parameters of an RSA/Key.
End-of informative comment:
```

Definition

```
typedef struct tdTCPA_RSA_KEY_PARMS {
    UINT32 keyLength;
    UINT32 numPrimes;
    UINT32 exponentSize;
    BYTE[] exponent;
} TCPA_RSA_KEY_PARMS;
```

Type	Name	Description
UINT32	keyLength	This specifies the size of the RSA key in bits
UINT32	numPrimes	This specifies the number of prime factors used by this RSA key.
UINT32	exponentSize	This SHALL be the size of the exponent. If the key is using the exponent from 10.4.1 then the exponentSize MUST be 0.
BYTE[]	exponent	The public exponent of this key

4.21 TCPA_CHANGEAUTH_VALIDATE

```
Start of Informative comment:
This situature provides an area that will stokes the new authorization data and the challenger's monee.
End-of Informative comment:
```

Definition

```
typedef struct tdTCPA_CHANGEAUTH_VALIDATE {
     TCPA_SECRET newAuthSecret;
     TCPA_NONCE n1;
} TCPA_CHANGEAUTH_VALIDATE;
```

Туре	Name	Description
TCPA_SECRET	newAuthSecret	This SHALL be the new authorization data for the target entity
TCPA_NONCE	n1	This SHOULD be a nonce, to enable the caller to verify that the target TPM is on-line.

4.22 TCPA_MIGRATE_SCHEME

Sien io innornative comment The selienc indicates how the Stad Migrate command smould handle the impation of the enarpted blob End of innormative comment

Definition

TCPA_MIGRATE_SCHEME values

Name	Value	Description
TCPA_MS_MIGRATE	0x0001	A public key that can be used with all TCPA migration commands other than 'ReWrap' mode.
TCPA_MS_REWRAP	0x0002	A public key that can be used for the ReWrap mode of TPM_CreateMigrationBlob.
TCPA_MS_MAINT	0x0003	A public key that can be used for the Maintenance commands

4.23 TCPA_MIGRATIONKEYAUTH

```
Stant of minomative comment:
This standard provides the good that the associated quiblic key has TPM; Oviner authorization to be a
migration key
Endrothinometrixe comment:
```

Definition'

```
typedef struct tdTCPA_MIGRATIONKEYAUTH{
    TCPA_PUBKEY migrationKey;
    TCPA_MIGRATE_SCHEME migrationScheme;
    TCPA_DIGEST digest;
} TCPA_MIGRATIONKEYAUTH;
```

Туре	Name-	Description
TCPA_PUBKEY	migrationKey	This SHALL be the public key of the migration facility
TCPA_MIGRAT E_SCHEME	migrationScheme	This shall be the type of migration operation.
TCPA_DIGEST	digest	This SHALL be the digest value of the concatenation of migration key, migration scheme and tpmProof

4.24 TCPA_AUDIT_EVENT structure

Ser of informative comment

Maissmustmerepeasate endemis of the auditing. The entites make log filaeshed together should entit the commentacen value her by the MPV. Mismatches motestacted estacks on the system of failures to property auditisevants

End of uniormative comment

IDL Definition

```
typedef struct tdTCPA_AUDIT_EVENT{
        TCPA_COMMAND_CODE ordinal;
        TCPA_RESULT returncode;
} TCPA_AUDIT_EVENT;
```

Туре	Name	Description
TCPA_COMMAND_CODE	ordinal	Ordinal of the command
TCPA_RESULT	returncode	Return code for the command

4.25 PCR Structures

Steinioidinioidineมีประสงกากอกใช

The YZCR, Structures texpose the information in IPGR register, allow for selection of IPGR tragister, o registers in the SEAL operation and being what information is held in the tPCR register.

Whese structures are in usercuring the wrapping or keys and sealing of blobs

End of Uniormative comment.

4.25.1 TCPA_EVENT_CERT

Stancof Intormative comment. Genincates majore to use when adding EV. CODE. GERT events to the log. Endrol/Informative comment.

Definition

```
typedef struct tdTCPA_EVENT_CERT {
    TCPA_DIGEST certificateHash;
    TCPA_DIGEST entityDigest;
    BOOL digestChecked;
    BOOL digestVerified;
    UINT32 issuerSize;
    [size_is (IssuerSize)] BYTE * issuer;
) TCPA_EVENT_CERT;
```

Туре	Name	Description
TCPA_DIGEST	certificateHash	Hash of the entire VE certificate
TCPA_DIGEST	entityDigest	Actual digest value of the entity
BOOL	digestChecked	TRUE if the entity logging this event checked the measured value against the digest value in the certificate. FALSE if no checking was attempted.
BOOL	digestVerified	Only valid when DigestChecked is TRUE. TRUE if measured value matches digest value in certificate, FALSE otherwise.
UINT32	issuerSize	Size of the Issuer parameter
BYTE*	issuer	Actual issuer certificate

4.25.2 TCPA_PCR_EVENT

Sarrofinformative comment.
Individual events are stored in the TCPA PCR LEVENT variably sized data structure.
ICPA defines the following event supporting into mail on types.
Event type Values.

-Value	Eveni Name	Commens
	JEV GODE CERT	The TRML atend event is in response to locating a firmware of software component to which a VE certificate was available. Tavent points to the VE certificate that shipped with the obtions firmware or software to discovered to other treams; size incleares the length of this structure ascentivality as the digest of the firmware, software of other code located Certificates are much to be agree to publish to the Presos environment, velication of Certificates saturities as symblety in the Presos environment, velication of Certificates saturities as a firmware. Sometiment the exemption of the firmware and the Presos environment of the case of the presonant of the presonant firm and the presonant firms are also the presonant firms and the presonant firms are also the present firms.
	EWCODE NOCERT	The revent was intresponse to loading a firmware or other software component but no VE certificate was found. The size is 0 and "Event is unused. However, ExtendValue as the digest of the firmware discovered. Absence of a VE certificate does not indicate lack of trust if merely indicates that at VE certificate was not available at this point in boot. Upper level software may be able to obtain such certificates.
2	REVEXIVE CONFIG.	The event describes the platform configuration. The supporting information is a platform or firmware defined XML datastructure that indicates security relevant hardware configuration information. The event logged to TRM Extend is the SHALI digest or the XML datastructure and the firmware quarantees that the configuration stated in the data structure is in effect when the firmware relinquishes controlled the next module in boot. Size is the size in oxies of the XML data structure and Event points to the data structure itself. The information may include size of physical memory number of processors chiese configuration, buses discovered and processor/bus frequences. Firmware vendors are free to deline the XML reporting structure and selections parameters that are important or the replations.
	EV.NO ACTION	The ration was not beformed. The corresponding DIGEST structure MUST be as a single structure digit in the LSB of the DIGEST structure and the single structure. And the value MUST rates be longed to the TPM using the corresponding TPM LEXENG probables. As supporting detal structure may be supported containing virial manufacture describes why the eventual of not recent if such supporting information is supplied, it should be wall formed XML (However this supporting information is supplied.
4.1	EVISEPARATOR	Aulistokacitons was complete. This event must be used if an ore that concreve it can be logged to the TRM and upper level software needs to be an ore that logging was completed.
5 7 (25)	EVACTION	PA/logged event This is a Unlood estring With the content defined by the Platform Specific specifications.

4.25.3 TCPA_PCR_SELECTION

```
Stantof informative comment.
Ilhisistruciuse providesta standardznetrodrof spagfyloga Ilst of P.G.R. registers.
Endrofrinformative comment.
```

Definition

```
typedef struct tdTCPA_PCR_SELECTION {
    UINT16 sizeOfSelect;
    [size_is(sizeOfSelect)] BYTE pcrSelect[];
} TCPA_PCR_SELECTION;
```

Parameters

Туре	Name	Description
UINT16	sizeOfSelect	The size in bytes of the pcrSelect structure
BYTE	pcrSelect	This SHALL be a bit map that indicates if a PCR is active or not

Description

When the least-significant-bit of byte [N+1] of pcrSelect is butted against the most-significant-bit of byte [N] of pcrSelect for (15>=N>=0), the contiguous bit array so formed SHALL represent PCR indices in monotonically increasing order, starting from PCR index zero represented by bit 0 of byte 0 of pcrSelect.

The state of each bit in pcrSelect indicates whether a PCR register is selected or not. When the bit is 1 then the corresponding PCR is selected, if 0 the PCR is not selected.

The TPM MUST support a minimum sizeOfSelect of 2, larger sizes are allowable. The TPM MAY support TCPA_PCR_SELECTION structures with a larger size.

4.25.4 TCPA_PCR_COMPOSITE

```
Stancomposite structure provides the circlex and value of the PSR negister to be used when regaining the value that SEALS an entity tealing composite.

[Spikof/Informative comments]
```

Definition

```
typedef struct tdTCPA_PCR_COMPOSITE {
    TCPA_PCR_SELECTION select;
    UINT32 valueSize;
    [size_is(valueSize)] TCPA_PCRVALUE pcrValue[];
    } TCPA_PCR_COMPOSITE;
```

Туре	Name	Description
TCPA_PCR_SELECTION	select	This SHALL be the indication of which PCR values are active
UINT32	valueSize	This SHALL be the size of the pcrValue field
TCPA_PCRVALUE	pcrValue[]	This SHALL be an array of TCPA_PCRVALUE structures. The values come in the order specified by the select parameter and are concatenated into a single blob

4.25.5 TCPA_PCR_INFO

```
Starkofinformative comment:
The TGPA: PCR INFO structure contains the information related to the wiscoping or alkey of the sealing of data, to a set of PORs

End of thir or matrix excomment:
```

Definition

```
typedef struct tdTCPA_PCR_INFO{
    TCPA_PCR_SELECTION pcrSelection;
    TCPA_COMPOSITE_HASH digestAtRelease;
    TCPA_COMPOSITE_HASH digestAtCreation;
} TCPA_PCR_INFO;
```

Туре	Name	Description
TCPA_PCR_SELECTION	pcrSelection .	This SHALL be the selection of PCRs to which the data or key is bound.
TCPA_COMPOSITE_HASH	digestAtRelease	This SHALL be the digest of the PCR indices and PCR values to verify when revealing Sealed Data or using a key that was wrapped to PCRs.
TCPA_COMPOSITE_HASH	digestAtCreation	This SHALL be the composite digest value of the PCR values, at the time when the sealing is performed.

4.26 Storage Structures

4.26.1 TCPA_STORED_DATA

End of informative comment

Start common mative comment:

The definition of this structure is necessary to ensure the enforcement of security properties

This structure is in use by the TPM useal and TPM Unseal commands to identify the IPGR index and values that must be present to properly this editor.

Definition

```
typedef struct tdTCPA_STORED_DATA {
    TCPA_VERSION ver;
    UINT32 sealInfoSize;
    [size_is(sealInfoSize)] BYTE* sealInfo;
    UINT32 encDataSize;
    [size_is(encDataSize)] BYTE* encData;
} TCPA_STORED_DATA;
```

Parameters

Туре	Name	Description
TCPA_VERSION	ver	Version number defined in section 4.5.
UINT32 _.	sealInfoSize	Size of the sealinfo parameter
BYTE*	sealInfo	This SHALL be a structure of type TCPA_PCR_INFO or a 0 length array if the data is not bound to PCRs.
UINT32	encDataSize	This SHALL be the size of the encData parameter
BYTE* encData		This shall be an encrypted TCPA_SEALED_DATA structure containing the confidential part of the data.

Descriptions

This structure is created during the TPM_Seal process. The confidential data is encrypted using a non-migratable key. When the TPM_Unseal decrypts this structure the TPM_Unseal uses the public information in the structure to validate the current configuration and release the decrypted data:

4.26.2 TCPA_SEALED_DATA

Start of informative comment:
This structure contains confidential imformation related to sealed data; including the data; itself;

Lend of informative comment.

Definition

```
typedef struct tdTCPA_SEALED_DATA {
    TCPA_PAYLOAD_TYPE payload;
    TCPA_SECRET authData;
    TCPA_NONCE tpmProof;
    TCPA_DIGEST storedDigest;
    UINT32 dataSize;
    [size_is(dataSize)] BYTE* data;
    } TCPA_SEALED_DATA;
```

Parameters

Туре	Name	Description
TCPA_PAYLOAD_TYPE	payload	This SHALL indicate the payload type of TCPA_PT_SEAL
TCPA_SECRET	authData	This SHALL be the authorization data for this value
TCPA_NONCE	tpmProof.	This SHALL be a copy of TPM_PERSISTENT_FLAGS -> tpmProof
TCPA_DIGEST	storedDigest	This SHALL be a digest of the TCPA_STORED_DATA structure, excluding the fields TCPA_STORED_DATA -> encDataSize and TCPA_STORED_DATA -> encData.
UINT32	dataSize	This SHALL be the size of the data parameter
BYTE!	data	This SHALL be the data to be sealed

Description

To tie the TCPA_STORED_DATA structure to the TCPA_SEALED_DATA structure this structure contains a digest of the containing TCPA_STORED_DATA structure.

The digest calculation does not include the encDataSize and encData parameters.

4.26.3 TCPA_SYMMETRIC_KEY

```
Stancofunionmetive comment.
This surviver describes a symmetric key, used curric the process O'Collating at Requestion at Trusted
Platform Wesbile desputy
(Enclof Uniormative comment)
```

Definition

```
typedef struct tdTCPA_SYMMETRIC_KEY {
    TCPA_ALGORITHM_ID algId;
    TCPA_ENC_SCHEME encScheme;
    UINT16 size;
    [size_is(size)] BYTE* data;
} TCPA_SYMMETRIC_KEY;
```

Name	Description
algId	This SHALL be the algorithm identifier of the symmetric key.
encScheme	This SHALL fully identify the manner in which the key will be used for encryption operations.
size	This SHALL be the size of the data parameter in bytes
data	This SHALL be the symmetric key data
	algId encScheme

4.26.4 TCPA_BOUND_DATA

Sar of miornative comment:

ijijis strudijirais delineo because ii is usao lova IPM. UnBird commend in a gonsister ov dheck

The Intention TOPA is to promote "best predice" heuristos for the Use of Reys a signing Re, should it be used for storage, and so on. These freuntiles are used because of the potential linears that raise when the same key is used in different ways. The heuristics minimize the number of ways in which argiver yev leanger used.

Operaudi Inaunaus inate (ex oftwar IPVLKE) BIND, and no other we of kay should always see User to realls the look that is upwarped by TPVL Upblid. Binding is not a IPV turnion, so the only Grobers to realizant a creek for the corner review type lying a look is universed by a key of hype TPVLKEY BIND. This reputes the tip to have heard structure.

Even though payloadDate has variable size. TOPA 180UND IDATA deliberately does not indude the size of perforable in the size of perforable in the seas to sensy use the size of perforable that seas to sensy use the size when IOPA 180UND IDATA is encrypted in a single block. When using TPAHUIBIA to obtain payload bate the size of payloadDate is declared seas natural result of the IRSA) decryption process.

End/of informative comment

Definition

```
typedef struct tdTCPA_BOUND_DATA {
    TCPA_VERSION ver;
    TCPA_PAYLOAD_TYPE payload;
    BYTE[] payloadData;
} TCPA_BOUND_DATA;
```

Parameters

Type	Name	Description
TCPA_VERSION	ver	Version number defined in section 4.5.
TCPA_PAYLOAD_TYPE	paylcad	This SHALL be the value TCPA_PT_BIND
BYTE[]	payloadData	The bound data

Descriptions

This structure MUST be used for creating data when (wrapping with a key of type TPM_KEY_BIND) or (wrapping using the encryption algorithm TCPA_ES_RSAESOAEP_SHA1_M). If it is not, the TPM_UnBind command will fail.

4.27 TCPA_KEY complex

Starkofijnformative.comment

The TRALKEY complex is where all orthe information reparting keys is kept. These structures combine to fully define and protective information regarding at asymmetric key.

4.27.2 TCPA_STORE_PUBKEY

```
Stantoffinionnative comment
This shruture can be used in conjunction with a source ponding TGPALKEY PARMS to construct a public key which can be unamble be used.

End of informative comment typedef struct tdTCPA_STORE_PUBKEY {
```

```
typedef struct tdTCPA_STORE_PUBKEY {
    UINT32 keyLength;
    BYTE[] key;
} TCPA_STORE_PUBKEY;
```

Parameters

Type	Name	Description
UINT32	keyLength	This SHALL be the length of the key field.
BYTE []	key	This SHALL be a structure interpreted according to the algorithm ld in the corresponding TCPA_KEY_PARMS structure.

Descriptions

The contents of the 'key' field will vary depending upon the corresponding key algorithm:

Algorithm Id	'Key' Contents
TCPA_ALG_RSA	The RSA public modulus

4.27.3 TCPA_PUBKEY

Serio നിരുന്നത്തു ഭാനന്ത്ര

The TOPA_PUBKEY situature contains the public portion of an asymmetric key pair. It contains all the information necessary for its unambiguous usage. It is possible to constaud this structure from a TCPA_KEY, using the algorithm Parms and publicay itelis.

End/of/informative comment

Definition

```
typedef struct tdTCPA_PUBKEY{
    TCPA_KEY_PARMS algorithmParms;
    TCPA_STORE_PUBKEY pubKey;
} TCPA PUBKEY;
```

Parameters

Туре	Name	Description
TCPA_KEY_PARMS	algorithmParms	This SHALL be the information regarding this key
TCPA_STORE_PUBKEY	pubKey	This SHALL be the public key information

Descriptions

The pubKey member of this structure shall contain the public key for a specific algorithm.

4.27.4 TCPA_STORE_ASYMKEY

Starko informative comment.

The TOPALS TORE. ASYMKEY skugure provides the area to identify the confidential information relate to a key. Trins will motivate the private key feet ors for an asymmetric key.

irne structure is designed so that encryption of a TCPA STORE ASYMKEY structure containing a 204 buRSA keycan locidore in one roperation flutre encrypting key/is 2048 bits.

Using ilypten IRSA northon the structure would malute IP, and when destine the key malute the Unananyared P-Cownia would be used to recover the Covenie

This structure provides the lesis of defining the profedion of the private key. For the complete description of the engineers see 8.4.4

Granges in this structur IMUST be referred in the TGPA_MUCRATE_ASYMEY structure (section) (1977-16)

                                                                         193-214
} TCPA STORE ASYMKEY;
```

Туре	Name	Description
TCPA_PAYLOAD_TYPE	payload	This SHALL set to TCPA_PT_ASYM to indicate an asymmetric key.
TCPA_SECRET	usageAuth	This SHALL be the authorization data necessary to authorize the use of this value
TCPA_SECRET	migrationAuth	This SHALL be the migration authorization data for a migratable key, or the TPM secret value tpmProof for a non-migratable key created by the TPM.
		If the TPM sets this parameter to the value tpmProof, then the TCPA_KEY.keyFlags.migratable of the corresponding TCPA_KEY structure MUST be set to 0.
		If this parameter is set to the migration authorization data for the key in parameter PrivKey, then the TCPA_KEY.keyFlags.migratable of the corresponding TCPA_KEY structure SHOULD be set to 1.
TCPA_DIGEST	pubDataDigest	This SHALL be the digest of the corresponding TCPA_KEY structure, excluding the fields TCPA_KEY.encSize and TCPA_KEY.encData.
		When TCPA_KEY -> pcrInfoSize is 0 then the digest calculation has no input from the pcrInfo field. The pcrInfoSize

		field MUST always be part of the digest calcuation.
TCPA_STORE_PRIVKEY	privKey	This SHALL be the private key data. The privKey can be a variable length which allows for differences in the key format. The maximum size of the area would be 151 bytes.

4.27.5 TCPA_STORE_PRIVKEY

```
Seri o'ilifornetive comment
This structure can be used in conjunction with a corresponding TOPA. PUBKEY to construct apprivate Rev.
Which can to supprintiguously used
Enclor intornative comment
```

```
typedef.struct tdTCPA_STORE_PRIVKEY {
      UINT32 keyLength;
      [size_is(keyLength)] BYTE* key;
} TCPA_STORE_PRIVKEY;
```

Parameters

Туре	Name	Description
UINT32	keyLength	This SHALL be the length of the key field.
BYTE*	key	This SHALL be a structure interpreted according to the algorithm Id in the corresponding TCPA_KEY structure.

Descriptions

All migratable keys MUST be RSA keys with two (2) prime factors.

For non-migratable keys, the size, format and contents of privKey.key MAY be vendor specific and MAY not be the same as that used for migratable keys. The level of cryptographic protection MUST be at least as strong as a migratable key.

Algorithm Id	key Contents
TCPA_ALG_RSA	When the numPrimes defined in the corresponding TCPA_RSA_KEY_PARMS field is 2, this shall be one of the prime factors of the key. Upon loading of the key the TPM calculates the other prime factor by dividing the modulus, stated in section 10.4.1: TCPA_RSA_PUBKEY, by this value.
	The TPM MAY support RSA keys with more than two prime factors. Definition of the storage structure for these keys is left to the TPM Manufacturer.

4.27.6 TCPA_MIGRATE_ASYMKEY

Sard mornalive comment

Tige: TGPA_WIGRATE_ASYMKEY structure provides the energo dentify the private key feator of a Examinetic keyovine the key is integrating between TPMs.

fine structure provides the besistof certring the protection of the private key for the complete description of the entire engagotion process see 7.2 (H)

     REFERENCE
                       p-ca_reference
     TCPA VERSION
                       TCPA_VERSION
     SIGNATURE.
                       signature_value}
```

This is an abstract definition; section 9.5.5 contains the concrete representation.

Parameters

Туре	Name	Description
ASCII_STRING	"TCPA Trusted Platform Module Identity"	This SHALL be the ASCII string "TCPA Trusted Platform Identity."
UNICODE	identityLabel	This SHALL be a textual string associated with the TPM identity.
TCPA_PUBKEY	identityPubKey	This SHALL be a public key associated with the TPM identity.
REFERENCE	tpm_model	This SHALL be a reference to the type of TPM in the platform, plus a reference to the identity of the manufacturer of TPM.
REFERENCE	tpm_distributed_validation	This SHALL be fields that indicate the security qualities of the TPM in the platform.
CONFORM_UID	tpm_pp	This SHALL be the UID that unambiguously identifies the protection profile of the TPM
CONFORM_UID	tpm_st	This SHALL be the UID that unambiguously identifies the security target of the TPM
REFERENCE	platform_model	This SHALL be a reference to the type of the platform, including the TCPA foundations in the platform, plus a reference to the identity of the manufacturer of that platform.
REFERENCE	platform_distributed_valid ation	This SHALL be fields that indicate the security qualities of the platform.
CONFORM_UID	foundation_pp	This SHALL be the UID that unambiguously identifies the protection profile of the TCPA foundations in the platform.
CONFORM_UID	foundation_st	This SHALL be the UID that unambiguously identifies the security target of the TCPA foundations in the platform.
REFERENCE	p-ca_reference	This SHALL be an unambiguous indication of the identity of the (Privacy CA) entity that attests to the TPM identity.
TCPA_VERSION	TCPA_VERSION	This SHALL be the version specified in section 4.5.
SIGNATURE	signature_value	This SHALL be the signature over all previous fields in TPM_IDENTITY_CREDENTIAL, using the private key of the p-ca_reference.

If the data structure TPM_IDENTITY_CREDENTIAL is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is available to authorized entities.

4.33 Command Ordinals

Stantoffinformative comment:

The commend addinals provide the thies, water for each commend. The following list coincids both the jidex value and afficient indicates the default authorise of the command. The commands saleded to be audied by default are those that substantially change the state of the TIAM and/or the protected storage the state of the TIAM and/or the protected storage the state.

ncepa commends are divided into daree classes. Protested/Vaprotested Aign-Connection/Gennector/ related-and normalism

and of informative comment:

Ordinals are 32 bit values. The upper byte contains values that serve as flag indicators, the next byte contains values indicating what committee designated the ordinal, and the final two bytes contain the Command Ordinal Index.

Where:

- P is Protected/Unprotected command. When 0 the command is a Protected command, when 1 the command is an Unprotected command.
- C is Non-Connection/Connection related command. When 0 this command passes through to either the protected (TPM) or unprotected (TSS) components.
- V is TCPA/Vendor command. When 0 the command is TCPA defined, when 1 the command is vendor defined.
- All reserved area bits are set to 0.

The following masks are created to allow for the quick definition of the commands

Value	Event Name	Comments
0x00000000	TCPA_PROTECTED_COMMAND	TPM protected command, specified in main specification
0x80000000	TCPA_UNPROTECTED_COMMAND	TSS command, specified in the TSS specification
0x40000000	TCPA_CONNECTION_COMMAND	TSC command, protected connection commands are specified in the main specification. Unprotected connection commands are specified in the TSS.
0x20000000	TCPA_VENDOR_COMMAND	Command that is vendor specific for a given TPM or TSS.

The following Purviews have been defined:

Value	Event Name	Comments
0x00	TCPA_MAIN	Command is from the main specification
0x01	TCPA_PC	Command is specific to the PC
0x02	TCPA_PDA	Command is specific to a PDA
0x03	TCPA_CELL_PHONE	Command is specific to a cell phone

Combinations for the main specification would be

Value	Event Name
TCPA_PROTECTED_COMMAND TCPA_MAIN	TCPA_PROTECTED_ORDINAL
TCPA_UNPROTECTED_COMMAND TCPA_MAIN	TCPA_UNPROTECTED_ORDINAL
TCPA_CONNECTION_COMMAND TCPA_MAIN	TCPA_CONNECTION_ORDINAL

If a command is tagged from the audit column the default state is that use of that command SHALL be audited. Otherwise, the default state is that use of that command SHALL NOT be audited.

5. Authorization and Ownership

5.1 Introduction

Start of informative commentate

ilhe purpose/of the authorization medianism is to authenticate an owner and to authorize use or an entit Bhe basic premise is toproverknowledge of a shared-secret, whis shared-secret is the authorization data.

Adhorzation dale is evaluate for the TRN Owner and each entity (keys, for example) that the TRN controls. The exilinative transition date for the TRN Owner and the SRK are held within the TRN itself and the authorzation date for other entities are their within the transition date for other entities are their with the entity

The TPN Owner adhorization sale allows the Owner toprove overship of the IIPN: Proving avaleship of the IIPN does not ininestally allow all ignorities — the IIRN Owner is not a super-user, and additional adhorization delatinustic provinci for each entity or operation that the speciestor.

ithe TPM treats knowledge of the authorization data as complete proof of comparing of the emitty. No other offects are necessary. The requestor (any entity that wishes to except ea communition, the TPM of use a specific unitly) thay frave additional crostediors and technicinents where he or she too it) saves the authorization data/however the TRM paces no additional requirements.

There are two protocols to securely passagroup of knowledge of authorization data from requestor to TPM, the 7-Object-Independent Authorization Protocol's (OFAR) and the 1-Object-Specific Authorization Protocol's (OSAR). The OFAR supports multiple authorization sessions for arbitrary entitles. The OSAR supports an authentication session for a single entity and enables the confidential transmission of new authorization information. That new authorization information is inserted by the Authorization Data Insertion Protocol's (ADIR) during the creation of an entity. The "Authorization Data Change Protocol" (ADIR) and the Taymmetric Authorization Change Protocol's (AACR) allow the changing of the authorization data for an entity. The protocol definitions allow expansion of protocol types to additional ToPA required protocols and vendor specific protocols.

The protocols use a follog notice peradigm. This requires that a notice from one side to in use only for a message and listraply. For instance, the TPM would create among and septithat on a reply. The requestor world nearly inches and then include it in the meximaters. The TPM would valuate that the remaining works from the TPM would valuate that the remaining works in the request and then details a new honce for the reply. This medianism is in place to preventably attends and many his another additions.

The less protocols do not provide long-term protection of cultivization date that is the teach of a passwork or other low-entropy entities. The TPM designer and application writer in estagoly additional, and each protection of these types of data is necessary.

The design efficient of the spiciocols is to allow for ownership at the floation, command and parameter authentication and preventical avancament in the privile at the key

Ne essine of the authorization eleta nortes and other parmeters must follow specify quite lines so that communes condit filon official connecte manifeature will interepetate property.

End of informative comment

All entity authorizations requiring authorization MUST use the authorization data protocols.

The TPM MUST support the OI-AP and the OS-AP which enable proof of knowledge of authorization data while maintaining the secrecy of that authorization data.

The TPM MUST support the ADIP that inserts the authorization during entity creation.

The TPM MUST support the ADCP and AACP which allow for the changing of authorization data.

The TPM MUST support TPM_Terminate_Handle which forces the termination of a session.

The TPM MAY support additional protocols to authenticate, insert and change authorization data.

The TPM MUST support the ability to calculate a HMAC in order to verify authorization data independent of the source or transmission mechanism. The TPM MUST calculate the HMAC digest according to section 8.6. The TPM MUST NOT perform the HMAC calculation for a returning message when the authorization for the command fails or the command fails for any other reason.

If a command has more than one authorization value, each authorization session MUST use the same SHA-1 parameter digest (<paramDigest> from Sect. 4.4.2) plus its respective authorization setup parameters (nonces, authHandles, etc) in the HMAC calculation. For example, the capability 9.3.1TPM_MakeIdentity requires authorization from both the TPM Owner and from the SRK owner. So the authentication information "TpmOwnerAuth" and "SrkAuth" are each calculated over all parameters tagged with an 'S' subscript in the definition of TPM_MakeIdentity.

All commands that use keys normally include at least one authorization session in the input parameters. If AuthDataUsage is set to TPM_AUTH_NEVER for that key, then the command does not need to be authorized. To implement this, the 5 authorization parameters at the end of the input parameter list should be removed and the tag value (first parameter) changed from TPM_TAG_RQU_AUTH1_COMMAND to TPM_TAG_RQU_COMMAND.

When an incoming command includes an authorization session but the authorized key has AuthDataUsage set to NEVER the TPM MUST perform the following:

- If the value of the command tag is TPM_TAG_RQU_AUTH1_COMMAND the TPM will compute the authorization based on the value store in the authorization location within the key, IGNORING the state of the AuthDataUsage flag.
- Users may choose to use a well-known value for the authorization data when setting AuthDataUsage to NEVER.

For commands that normally have 2 authorization sessions, if the tag specifies only one in the parameter array, then the first session listed is ignored (authDataUsage must be NEVER for this key) and the incoming session data is used for the second auth session in the list.

5.1.1 Tag Usage

This table summarizes what can be the tag with a given TPM command.

5.2 Authorization protocols

Startsof informative comments

Tine TRM provides two protocols for authorizing the rise of entitles without revealing the authorization data on the retwork or the connection to the IFRM. In both cases, the protocol exchanges monacide a so that both sides of the transaction team compute a trash using shared seads and honce data. Each side generates the hash value and can compare to the value transmitted. Network listeness cannot disently interthe authorization data from the hashed objects sensover the network.

The first protocol is the "Object independent Authorization Protocol" (OPAP), Windustlows the extenses of horizes witherspecific TRM Chockin OPAP session is established its noncestable used to suithorize und use siny entity managed by the TRM. The session can live indefinitely writher transfrouses the session (aminotion The TRM COMP (transformstable) PAP session.

The second protocol is the "Object Specific Authorization Protocol (OSPAP). The OSPAP allows establishment of an authoritication session for a single entity this session drates nonces that eath authorize multiple commands without additional session establishment overhead, but is bound to a social entity. The TRVLOSAP command statis the OSPAP session, The TRVLOSAP specifies the entity to write the Figure TRVLOSAP specifies the Entity to the Entity to the Entity the Figure TRVLOSAP specifies the Entity to the Entity to the Entity the Entity

Most reminands allow either form of authorization protecol; tingeneral; however, the @-AP is preferred = it is more generally useful because it allows usage of the same session to provide authorization for different entities. The @S-AP is showever, necessary for operations that set or reset authorization data.

OPAP sessions were designed for reasons of efficiency; only one setup process is required for potentially many authorizations.

An OS AP session is doubly efficient because only one setup process is required for potentially many authorization calculations and the entity authorization secret is required only once. This minimizes exposure of the authorization secret and can inhimize laurean interaction in the case where a recision supplies the authorization shormation. The disadvantage of the OSAAP is that a distinct session needs to be setup for each entity that requires authorization. The OS-AP deales an ephemeral secret that is used throughout the session instead of the entity authorization secret into appear and secret that is used to provide confidentiality for the introduction of new authorization data curing the realism of new authorization of all output for the reproduction of new authorization data curing the realism of new authorization of the Introduction of new authorization recursives scienter minator (as usual) tour the IPM roces the termination of an OS-AP session after use of the ephemeral secret to the Introduction of new authorization of the representation of the Introduction of new authorization of the ephemeral secret to the Introduction of new authorization of the ephemeral secret to the Introduction of new authorization for the confidence of the Introduction of new authorization of the ephemeral secret to the Introduction of new authorization of the ephemeral secret to the Introduction of new authorization for the ephemeral secret to the Introduction of new authorization for the ephemeral secret to the Introduction of new authorization for the ephemeral secret to the Introduction of new authorization for the ephemeral secret to the Introduction of new authorization for the ephemeral secret to the Introduction of the Introd

Fortools the OSAP engline OFAP session setup is interpendented the commends that are sustained. In the case of OFAP, the requestor sends the TPMLOFAP commend and with the response generated by the TPM, can diministry required horizing region calons. The OSAP is very similar and statis with the requestor sending a TPM_OSAP operation. Training the entity to which the authorization session structs be bound.

Both session types use a "noting tropes" paradigm: Tripstineens that the TPM creates a new homes value each innet he TRM uses the session for a HMAC calculation.

Note that some operations involve the use of two authorization elements (for example, UNSE/AL resulted the authorization care of the object uself and authorization talk of the objects parent, the this case, two separatesessions are required alustrous established second assistant or both pulposes. For the purposes of the informative comments for the individual protocols. The following example command will be used, named ITAM Example: No distribus command has a single authorization session, and that the authorization session with some Key. Commands that this document have from 6 to 2 authorization sessions.

Some commands wildingliks coordinant use seerals other than the auth value tine stey. Two exemples would be owner actionized commands or commands using stey/Migration as the secral flowing case. Key usage Auth in the examples below would be replaced with owner Author stey/Migration or other secrals as necessary. In all cases, the secral used to compute the authorization digest is noted in three case) promote the authorization digest is noted in three case) in the accurate that the case in the secral used to compute the authorization digest is noted in three case) in the accurate that the command case of the secral transfer than the case of the secret transfer than the case of the secral transfer to secral transfer than the case of the secret transfer than the case of the secret transfer than the secret transfer than the case of the secret transfer than the secret transfer transfer transfer than the se

2	4			UINT32	paramSize	Total number of input bytes including paramSize and tag	
3	4			TCPA_COMMAND_CODE	ordinal	Command ordinal, fixed value of TPM_ORD_OIAP.	

Outgoing Operands and Sizes

PAI	RAM	HN	IAC	Type Name	Name	Description
#	SZ	#	SZ	,,,,,,	7.0	Description
1	2			TCPA_TAG	tag	TPM_TAG_RSP_COMMAND
2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4			TCPA_RESULT	returnCode	The return code of the operation, See section 4.3.
4	4			TCPA_AUTHHANDLE	authHandle	Handle that TPM creates that points to the authorization state.
5	20			TCPA_NONCE	nonceEven	Nonce generated by TPM and associated with session.

Actions

- 1. The TPM_OIAP command allows the creation of an authorization handle and the tracking of the handle by the TPM. The TPM generates the handle and nonce.
- 2. The TPM has an internal limit as to the number of handles that may be open at one time, so the request for a new handle may fail if there is insufficient space available.
- 3. Internally the TPM will do the following:
 - a) TPM allocates space to save handle, protocol identification, both nonces and any other information the TPM needs to manage the session.
 - b) TPM generates authHandle and nonceEven, returns these to caller
- 4. On each subsequent use of the OIAP session the TPM MUST generate a new nonceEven value.

5.2.3 Authorization using an OI-AP session

Sert ថា ក្រាសាកាមួយ១ Gomment

This section describes the authorization-related actions of a TIPM: When it receives a command that ha been authorized with the OFAP noticed:

Vany commence useOFAP atthornation. The following cesterprion/is the storether places and abstract

adorniomaliye comment:

Actions

...

perform the following actions:

- 1. The TPM MUST verify that the authorization handle (H, say) referenced in the command points to a valid session. If it does not, the TPM returns the error code TCPA_AUTHFAIL.
- 2. The TPM SHALL retrieve the latest version of the caller's nonce (nonceOdd) and continueAuthSession flag from the input parameter list, and store it in internal TPM memory with the authSession 'H'.
- 3. The TPM SHALL retrieve the latest version of the TPM's nonce stored with the authorization session H (authLastNonceEven) computed during the previously executed command.
- 4. The TPM MUST retrieve the secret authorization data (SecretE, say) of the target entity. The entity and its secret must have been previously loaded into the TPM.
- 5. The TPM SHALL perform a HMAC calculation using the entity secret data, ordinal, input command parameters and authorization parameters per section 4.4.2.
- 6. The TPM SHALL compare HM to the authorization value received in the input parameters. If they are different, the TPM returns the error code TCPA_AUTHFAIL. Otherwise, the TPM executes the command which (for this example) produces an output that requires authentication.
- 7. The TPM SHALL generate a nonce (nonceEven).
- 8. The TPM creates an HMAC digest to authenticate the return code, return values and authorization parameters to the same entity secret per section 4.4.2
- The TPM returns the return code, output parameters, authorization parameters and authorization digest.
- If the output continueUse flag is FALSE, then the TPM SHALL terminate the session. Future references to H will return an error.

5.2.4 OS-AP Description

Start of informative comment-

The OS-AP command creates en equemoral secretic authenticate creasion. The purces of this section is to illustrate the CS-AP without regard to a specific command. See Section 5.2.5 for the TPN OSAF description which is used to create this cultivization session

Assume that a TIPM user wishes to send commend TIPM Exemple. This as an authorized commend that uses the tay denoted to the the The user must know the authorization cale to they hardle (tayusage Authorization) as the landy that dequires authorization and this seems is used in the authorization.

Lightes assume for this example that the callent of TRM is ample peaks to use this key intuitible times but to deep and the cample that the cample of the cample that the cample the cample that the cample that the cample that the cample and the cample to the cample to

Outgoing Operands and Sizes

PA	RAM	H	VAC	Туре		
#	SZ	#	SZ	Туре	Name	Description
1	2			TCPA_TAG	tag	TPM_TAG_RSP_COMMAND
2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.
4	4			TCPA_AUTHHANDLE	authHandle	Handle that TPM creates that points to the authorization state.
5	20			TCPA_NONCE	nonceEven	Nonce generated by TPM and associated with session.
6	20			TCPA_NONCE	nonceEvenOSAP	Nonce generated by TPM and associated with shared secret.

Actions

- The TPM_OSAP command allows the creation of an authorization handle and the tracking of the handle by the TPM. The TPM generates the handle, nonceEven and nonceEvenOSAP.
- 2. The TPM has an internal limit on the number of handles that may be open at one time, so the request for a new handle may fail if there is insufficient space available.
- The TPM_OSAP allows the binding of an authorization to a specific entity. This allows the caller to
 continue to send in authorization data for each command but not have to request the information or
 cache the actual authorization data.
- 4. Internally the TPM will do the following:
 - a. TPM receives command.

- b. TPM generates new handle and reserves space to save protocol identification, shared secret, both nonces and any other information the TPM needs to manage the session.
- c. TPM generates nonces nonceEven and nonceEvenOSAP.
- d. The TPM calculates the shared secret using an HMAC calculation. The key for the HMAC calculation is the secret authorization data assigned to the key handle identified by entityValue. The input to the HMAC calculation is the concatenation of nonces nonceEvenOSAP and nonceOddOSAP. The output of the HMAC calculation is the shared secret which is saved in the authorization area associated with authHandle

Descriptions

entityType = TCPA_ET_KEYHANDLE

The entity to authorize is a key held in the TPM. entityValue contains the keyHandle that holds the key.

entityType = TCPA_ET_OWNER

This value indicates that the entity is the TPM owner. entityValue is ignored.

entityType = TCPA_ET_SRK

The entity to authorize is the SRK. entityValue is ignored.

Usage

On each subsequent use of the OSAP session the TPM MUST generate a new nonce value.

The TPM MUST ensure that OS-AP shared secret is only available while the OS-AP session is valid.

Termination

The session MUST terminate upon any of the following conditions:

- The entity is unloaded.
- The entity has a change authorization performed on it.
- The session is used in a TPM_ChangeAuth command.
- The command that uses the session returns an error.

5.2.6 Authorization using an OS-AP session

Sero Minioruelixe comment This section describes the enthorization related actors of a TPM when it receives a command that the been authorized with the OS-AP projector. Many commands use OS-AP authorization. The following description is therefore hecessarily abstract. Enclosyniounalize comment

Actions

On reception of a command with ordinal C1 that uses an authorization session, the TPM SHALL perform the following actions:

- The TPM MUST have been able to retrieve the shared secret (Shared, say) of the target entity when the authorization session was established with TPM_OSAP. The entity and its secret must have been previously loaded into the TPM.
- 2. The TPM MUST verify that the authorization handle (H, say) referenced in the command points to a valid session. If it does not, the TPM returns the error code TPM_AUTHFAIL.
- 3. The TPM MUST calculate the HMAC (HM1, say) of the command parameters according to section 4.4.2
- 4. The TPM SHALL compare HM1 to the authorization value received in the command. If they are different, the TPM returns the error code TPM_AUTHFAIL. Otherwise, the TPM executes command C1 which produces an output (O, say) that requires authentication and uses a particular return code (RC, say).
- 5. The TPM SHALL generate the latest version of the even nonce (nonceEven).
- 6. The TPM MUST calculate the HMAC (HM2) of the return parameters according to section 4.4.2
- 7. The TPM returns HM2 in the parameter list.
- 8. The TPM SHALL retrieve the continue flag from the received command. If the flag is FALSE, the TPM SHALL terminate the session and destroy the thread associated with handle H.

If the shared secret was used to provide confidentiality for data in the received command, the TPM SHALL terminate the session and destroy the thread associated with handle H.

Each time that access to an entity (key) is authorized using OSAP, the TPM MUST ensure that the OSAP shared secret is that derived from the entity using TPM_OSAP.

5.3 TPM_Terminate_Handle

2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.

Descriptions

A TPM SHALL unilaterally perform the actions of TPM_Terminate_Handle upon detection of the following events:

- Completion of a received command whose authorization "continueUse" flag is FALSE.
- Completion of a received command when a shared secret derived from the authorization session
 was exclusive-or'ed with data (to provide confidentiality for that data). This occurs during
 execution of a TPM_ChangeAuth command, for example.
- When the associated entity is destroyed (in the case of TPM Owner or SRK, for example)
- Upon execution of TPM_Init
- When the command returns an error. This is due to the fact that when returning an error the TPM
 does not send back nonceEven. There is no way to maintain the rolling nonces, hence the TPM
 MUST terminate the authorization session.
- Failure of an authorization check belonging to that authorization session.

Actions

The TPM SHALL terminate the session and destroy all data associated with the session indicated.

5.4 ADIP - Creating a New Entity

Start of informative comments

The areation of the authorization care is the responsibility of the entity given. He or she may use whatever process he or she wishes. The transmission of the authorization cale from the lowner to the TPM requires controlated by and integrity fine enorgation of the authorization real meets these requirements. The confidentiality and integrity requirements assume the insortion of the currentation data coolisions are made insortions of the care would not require these reasures the protocolis established to be consistent with both local and are more insortions.

When the requesions sending the authorization determine TRM. The command to local the determines the authorization of the cality owner. For exemple, to create a new TRM (D. and set its authorization date requires the authorization date of the TRM (Owner)

The confidentiality of the drawnission comes from the energinon of the authorization data, and the lightenity comes from the ability of the owner to well, with the authorization is being sent to a TPM and that only a specific TPM can decrypt the wall

iline medianism uses the following teatures of the IRPMLQS=XP rand HIVV.C

The TPM MUST enable ADIP by using the OS-AP. The TPM MUST encrypt the authorization data for the new entity by performing an XOR using the shared secret created by the OS-AP.

The TPM MUST destroy the OS-AP session whenever a new entity is created.

5.5 ADCP - Changing Authorization Data

Skrigorimornative.comment

All entitles from the Owner to the SRK to individual tags end cale blocs have enhoned for data. This cale many meet to change at some point in time after the entity oration. The ADGP allows the entity owner to obtaine the authorization cale. The entity owner of a wrapped key is the owner of the easen. Tray

A requirement is that the covier must remember the old authorization date. The only imponenting to whenge the authorization date when the entity owner longers the current value is to delete the entity and Then recrease it

To protective detection exposure to eaverdiopies or other alegkers, the subjorgation detective subjective subjectives and appropriate the subjective of the

Oranging authorization date equites opening two authoritietton handles. The line handle authoritiette it antique of the interior of the interi

Time authorization data in use to generate the OSANP shared seere trius the the authorization data of the parent of the entity to which the change will be made.

When changing the authorization data for the SRK, the first bandle OSAP must be setup using the liPV Owner authorization data. This is because the SRK does not have a patent, perse.

If the SRKAuth data is known to userA and userB, userA can snoop on userB while userB is changing the authorisation for a child of the SRKs and deduce the childs newauth. Therefore, it SRKAuth is a real known, value, TRM_GrangeAuthAsymStant, and TRM_GrangeAuthAsymFinish, are spretened over TRM_GrangeAuth when changing authorisation to colldrep of the SRK.

Ansapplies to all children o the SRK instrument PM udentities

land of this of matrix economent.

Changing authorization data for the TPM SHALL require authorization of the current TPM Owner.

Changing authorization data for the SRK SHALL require authorization of the TPM Owner.

If SRKAuth is a well known value, TPM_ChangeAuth SHOULD NOT be used to change the authorisation value of a child of the SRK, including the TPM identities.

All other entities SHALL require authorization of the parent entity.

5.6 Changing authorization values

Startiof informative comment

Cheming althorization comes in two flevors one to bendle blobs with extremzation and one to handle to althorization for the TPM Owner and SRK

Tunotionally these we commands parious the same operation and operate on the same violes the only difference les in who authorizes the goeration and where the cate comes in in.

l⊒nd of antormativææomment

5.6.1 TPM_ChangeAuth

Serionimente

The NIPM ChangeAuth command allows the owner of an entity to change the authorization data for the eplity

TPM_ChanceAuthtequies the encryption of one parameter ("NevyAuth")) from he sake of unito mittly with other commands (that require the encryption of more than one commander the string used for XOP companies that one commander the string used for XOP consistent in the extentioned formal of culturation the OSAP session with the session shared search and then hesting the result.

Tine parameter list to this command mustralways linclude two authorization sessions, regardless of the state of authDataUsage:for the respective keys.

Descriptions

A TPM MUST support the TPM_PID_ADCP protocol.

TPM_PID_ADCP protocol descriptions

The parentAuthHandle session type MUST be TCPA_PID_OSAP.

TPM_PID_ADCP protocol actions

- 1. Verify that entityType is one of TCPA_ET_DATA, TCPA_ET_KEY and return the error TCPA_WRONG_ENTITYTYPE if not.
- 2. The encData field MUST be the encData field from either the TCPA_STORED_DATA or TCPA_KEY structures.
- 3. Create s1 string by concatenating (parentAuthHandle -> shared secret || authLastNonceEven)
- 4. Create x1 by performing a SHA1 hash of s1
- 5. Create decryptAuth by XOR of x1 and newAuth.
- 6. parentAuthHandle MUST be built using the parent entity's authorization data.
- 7. The TPM MUST validate the command using the authorization data in the parentAuth parameter. The parentRef parameter provides the identification of the parent.
- 8. After parameter validation the TPM creates b1 by decrypting inData using the key pointed to by parentHandle.
- 9. The TPM MUST validate that b1 is a valid TCPA structure by verifying that the command has been authorized to use the blob. This checks that 20B of the decrypted blob have the proper value, and provides statistical proof that the blob was correctly decrypted.
- 10. The TPM replaces the authorization data for b1 with decryptAuth created above.
- 11. The TPM encrypts b1 using the appropriate mechanism for the type using the parentKeyHandle to provide the key information.
- 12. The new blob is returned in outData when appropriate.
- 13. The TPM MUST enforce the destruction of both the parentAuthHandle and entityAuthHandle sessions.

5.6.2 TPM_ChangeAuthOwner

Sentormornative comment:

and TPM: Change AuthOwner comment allows the owner of an antipitor dianger the authorization data to the TPM Owner of the SRK

This commend requires authorization from the current TPM Owner to execute

Descriptions

A TPM MUST support the TPM_PID_ADCP protocol.

In this capability, the SRK cannot be accessed as entityType TCPA_ET_KEY, since the SRK is not wrapped by a parent key.

TPM_PID_ADCP protocol descriptions

The ownerAuthHandle session type MUST be TCPA_PID_OSAP.

TPM_PID_ADCP protocol actions

- 1. Verify that entityType is either TCPA_ET_OWNER or TCPA_ET_SRK, and return the error TCPA_WRONG_ENTITYTYPE if not.
- 2. The ownerAuthHandle -> entityType MUST be TCPA_ET_OWNER.
- 3. Create s1 string by concatenating (ownerAuthHandle -> shared secret || authLastNonceEven)
- 4. Create x1 by performing a SHA1 hash of s1
- 5. Create decryptAuth by XOR of x1 and newAuth.
- 6. The TPM MUST enforce the destruction of the ownerAuthHandle session upon completion of this command (successful or unsuccessful). This includes setting continueAuthSession to FALSE
- 7. Set the authorization data for the indicated entity to decryptAuth

5.7 Asymmetric Authorization Change Protocol

Staricolinformative comment:

ithis esymmetric grange protoco: allows the entity owner to drange entity suthorization. Under the parentles execution enthorization to envalue of which the parent less nonviousledge.

in remirest. The TIPVI Charge Auth command uses the parent antity authorization data to create the Shared secret that charges has new authorization cate for an entity. This creates a studion where he carent entity ALSWAY'S knows the authorization data for entities in the free below the parent. There may be has eness where this knowledge is not a good rollay.

This asymmetric dialogo process requires avo commands and thouser of an estimoneation session

l≡h@lö/#itiormative¥comment

Changing authorization data for the SRK SHALL involve authorization by the TPM Owner.

If SRKAuth is a well known value,

TPM_ChangeAuthAsymStart and TPM_ChangeAuthAsymFinish SHOULD be used to change the authorisation value of a child of the SRK, including the TPM identities.

All other entities SHALL involve authorization of the parent entity.

10	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: parentKey.usageAuth.

Description

If the parentHandle points to the SRK then the HMAC key MUST be built using the TPM Owner authorization.

Actions

- 1. The TPM SHALL validate that the authHandle parameter authorizes use of the key in parentHandle.
- 2. The encData field MUST be the encData field from TCPA_STORED_DATA or TCPA_KEY.
- 3. The TPM SHALL create e1 by decrypting the entity held in the encData parameter.
- 4. The TPM SHALL create a1 by decrypting encNewAuth using the authHandle -> TPM_KEY_AUTHCHANGE private key. a1 is a structure of type TCPA_CHANGEAUTH_VALIDATE.
- 5. The TPM SHALL create b1 by performing the following HMAC calculation: b1 = HMAC (a1 -> newAuthSecret). The secret for this calculation is encData -> currentAuth. This means that b1 is a value built from the current authorization value (encData -> currentAuth) and the new authorization value (a1 -> newAuthSecret).
- 6. The TPM SHALL compare b1 with newAuthLink. The TPM SHALL indicate a failure if the values do not match.
- 7. The TPM SHALL replace e1 -> authData with a1 -> newAuthSecret
- 8. The TPM SHALL encrypt e1 using the appropriate functions for the entity type. The key to encrypt with is parentHandle.
- 9. The TPM SHALL create saltNonce by taking the next 20 bytes from the TPM RNG.
- The TPM SHALL create changeProof a HMAC of (saltNonce concatenated with a1 -> n1) using a1 -> newAuthSecret as the HMAC secret.
- 11. The TPM MUST destroy the TPM_KEY_AUTHCHANGE key associated with the authorization session.

Authorization Data 5.8

Seraco பற்றொளில் குற்றாள்

The authorization data is a 160-bit field that the TFM stores in a state of Joseph , which is an area where data is protected against interterence and priving, independent of its form. The Owner has a topy of the data and protects the data using whatever incohenism the Owner wishes to use Trine altification data is a shared secret dativer in the JPM and the Joviner of the entity. There are no requirements as to what the 180 of class are. The assumption is the data is a SHA-I hash of a password or other en en la company de la company

Mano will be a separate coer of authorization data for each entity. There is no requirement that each and the section gales properties and the sample is

TROC TIPO Ureats the avitnorization deta as sincles data, an eporoach that requires that conty TIRO protested repabilities access the authorization data. A further requirement is that the only use of the authorization data within the IRPN is in the authorization process. No other use is reminssible

illuciosotestion cirthe local voltaed nantsmis a Mosaci sufficiettem

Englotinioanetive commen

The TPM MUST reserve 160 bits for the authorization data. The TPM treats the authorization data as a blob. The TPM MUST keep the authorization data in a shielded location.

The TPM MUST enforce that the only usage in the TPM of the authorization data is to perform authorizations.

5.9 Nonces

Ser. ்சிர்க்கள் இரையாக விருக்கிற்கள் இருக்கு இருக்கு இருக்கு இருக்கு இருக்கு இருக்கு இருக்கு இருக்கு இருக்கு இ

All of the sufficient and an instruction of some all persons alter and some alternation of the solution of the instruction of the second was all instructions and antiques and alternations and an instruction of second with a second with a second with a second with a second of
The nonge values from the TRM must use the internal RNG. The honce values from the requestor can use any source that provides information to the requestor The highest value is obtained when the requestor also uses an RNG for the rende values, reviewed therets no loss of sequity to the IRM first values are in use. The requestor loses some protection when the or size (ont) uses so values.

ithe requestor is responsible to generaling and sending the obtanones value. The TPM may remones that The look mones value changes for each request:

The TPM is responsible to the even house values. The TPM entres it evenue of the even house of cash reply

The office matrix comment

The requestor SHOULD provide a unique value in the odd nonce field of the authorization structure for each request. The TPM MAY enforce the uniqueness of values from the requestor.

The TPM MUST supply a new nonce value for each reply. The nonce value MUST come from the internal RNG. The TPM MUST enforce the validity of the returning nonce another command uses the authorization session.

5.10 Authorization Handle

Stein of பார்சாய் அன்றார்.

Tine TPV) generies authorization handles to allow for the trading of uniornation reparding a seculi authorization involvation

The TRV saves information specific to the enthorization, such as the nones values cohemical saves and type of authoritication in use

aline TIPM initiv create any potemet representation of the mandle that its appropriate too the TIPM's design The requestor always uses the handle in the authorization structure to hadrete authorization structure in Juse

jihe TPM musi suppoti a immum of two corrounent authonestoniandes. The use of diese sendles i to allow the Owner to baye an authorization active in addition to an aptive authorization to an entity

Tio ensure general edilection and the proper demoval of security. Information the requesto should lempinate all nameles. Teamination of the handle uses the continueruse flag to indicate to the 1920 that the lagraters hould be commissive

Termicalibre of a mandle institucis the TPM to perform garage collection on all authorization data Canaage collection includes the deletion of the ephemeer search

End of informative comment

The TPM MUST support authorization handles. The TPM MUST support a minimum of two concurrent authorization handles.

The TPM MUST support authorization-handle termination. The termination includes secure deletion of all authorization session information.

5.11 TPM Ownership

Starcommonative.comment

The Owner of the TPV has the highly to perform special operations. The pieces of texture owner hip is the procedure whereville to whe chest is a hard segret into the TPV, the all future operations, anowedge of the special segret is proof of ownering. When the owner wishes to perform one of the special operations then the proof operations the perform one of the special operations then the Owner wishes to perform one of the special operations then the Owner wishes to perform one of the special operations then the Owner wishes to perform one of the special operations then the Owner wishes the sufficiency special to the owner wishes to be a special of the special operations the owner wishes the owner of the owner wishes the owner of the owner owne

Tine (TPM deleuit slete is to bevein a Owner

The efficulty with Oxyneratio is inserting the signer secret in a secure manner Avelegon consideration is that the Bland of Oxyneratio must be six operation it at works securely over the heavior? This function thus repovide confidentially and integrity to the messages senutofine 1927).

Tine: Lunation to insertine Owner must introvice the following

- e Confidentally, The states seed. (or authorization data) mast remail confidental ite al eavestroperation interceptiony of the messages. The confidentality corner from encryoting the stated seems using the TRM PUBEK, The Ownerwals that only the TRM has the PRIMER that ear design the stated seems
- o integrity. The TRIM and the Owner must be able to determine the integrity of messages and responses to the integrity of messages and responses to decur at the instant of receiving a message. The Owner validates the integrity of the messages using the EMAC construct.
- Remoteness: the function must allow the Owner to take control/across an etwork
- Merifiability: The function allows the Owner to verify that he or she has truly taken controls tine lowner verifies. That the responser was successfully installed by verifying the HMAC responser Additional verifications an occur by attempting to establish at Owner session.
- The IPM allake@wnership dunction inserts the Owner authorization data and creates athew storage Roo Key (SRK). The IPM TakeOwnership traction falls if the elistal ready an owner set for the HPM.

After inserting the authorization date, the TRML hakeOwnership function at ales the SRK. The SRK tike any other key) can be thicked to export

To valdae that the question completes subcessfully, the TRM HIMAGS the descouse to the

The TPM MUST ship with no Owner installed. The TPM MUST use the ownership-control protocol.

5.11.1 TPM_TakeOwnership

Type

TCPA protected capability; user must encrypt the values using the PUBEK.

7	20			TCPA_AUTHDATA		The authorization digest for the returned parameters. HMAC key: the new ownerAuth value

Actions

The new owner MUST encrypt the Owner authorization data and the SRK authorization data using the PUBEK. The endorsement key pair MUST be an RSA key so the encryption algorithm in use to encrypt these secrets is RSA.

If the TPM has a current owner then the TPM upon receipt of this command SHALL return the error code TCPA_OWNER_SET.

If the TPM has no current owner then the TPM upon receipt of this command SHALL:

- 1. If no EK is present the TPM MUST return TCPA_NO_ENDORSEMENT
- 2. If TCPA_PERSISTENT_FLAGS -> ownership is FALSE, the TPM SHALL abandon the process of granting ownership and return the error TCPA_INSTALL_DISABLED
- 3. Verify that the authorization session is of type OI-AP.
- 4. Decrypt EncOwnerAuth using the PRIVEK to generate ProspectiveOwnerAuth.
- 5. Use the TCPA authorization protocol to verify that all input parameters tagged with AUTH have been sent by an entity that knows ProspectiveOwnerAuth.
- 6. Store ProspectiveOwnerAuth as the Owner's authorization data.
- 7. Generate a new SRK in accordance with the algorithm parameter. In version 1 of the specification, algorithm MUST indicate a 2048 bit RSA key.
- 8. Verify that srkParams->keyUsage is TPM_KEY_STORAGE. If it is not, return TCPA_BAD_PARAMETER".
- 9. Verify that srkParams->keyFlags->migratable is FALSE. If it is not, return TCPA_BAD_PARAMETER"
- 10. Decrypt EncSrkAuth using the PRIVEK and store the result as the SRK's authorization data.
- 11. Obtain a TCPA_NONCE from the TPM's Random Number Generator and store it as TCPA_PERSISTENT_DATA -> tpmProof. tpmProof SHALL be stored in TCPA shielded locations, only.
- 12. Return the public part of the SRK to the caller.
- 13. Calculate an authenticated response using the new authorization data

6. Integrity Collection and Reporting

Introduction 6.1

Startof intornative comment.

The TGPA Trusto Plation Support Services (TSS), provides medianisms for cryptographically, reporting the outent bardware and software configuration of a computing device to local and ramote Ghallenges. The TSS also provides allowed in features storage capability, which allows the Subsystem Owner to store an acceptable pation configurator, blometro date of other date than savallable carry in book, system firmware or other software from use this storage expability to pame Uses qualified to see or o acceptable tool configurations. TGPA specification tools (not colling the volvethis storage feature).

The TSS also provides a seality whereas relations software of firmware they store searchs that are algorish only when the plations is in a defined contiguation. This mechanism is known as sealing, that following sealing continuity of the trusted Platform Module (IPPN)-protected operations that support integrity collection and define the trusted Platform Module (IPPN)-protected operations that support integrity collection and reporting the usage required in a TGPA+complant PC to although the desembedan a separate dosumen.

Endlof:Informative comment

6.2 Platform Configuration Registers

6.2.1 Format and Properties

A Platform Configuration Register (PCR) consists of a 160-bit field that holds a cumulatively updated hash value and a 4-byte status field. The PCR data structure MUST be a TCPA-shielded location. PCRs SHOULD be in volatile storage. The PCRs MUST be set to 0 before first use. This specification does not mandate the internal storage format.

A TPM implementation MUST provide 16 or more independent PCRs. These PCRs are identified by index and MUST be numbered from 0 (that is, PCR_0 through PCR_{15} are required for TCPA compliance). Vendors MAY implement more registers for general-purpose use. Extra registers MUST be numbered contiguously from 16 up to max – 1, where max is the maximum offered by the TPM.

The TCPA-protected capabilities that expose and modify the PCRs use a 32-bit index, indicating the maximum usable PCR index. However, TCPA reserves register indices 2^{30} and higher for later versions of the specification. A TPM implementation MUST NOT provide registers with indices greater than or equal to 2^{30} . In this specification, the following terminology is used (although this internal format is not mandated).

6.2.2 Initialization

PCRs and the protected capabilities that operate upon them MAY NOT be used until power-on self-test (TPM POST) has completed. If TPM POST fails, the TPM_Extend operation will fail; and, of greater importance, the TPM_Quote operation and TPM_Seal operations that respectively report and examine the PCR contents MUST fail. At the successful completion of TPM POST, all PCRs MUST be set to 0. Additionally, the UINT32 flags MUST be set to zero.

6.2.3 Authorized PCRs

A TPM MUST provide one Data Integrity Register (DIR). Implementations MAY provide more. These registers MUST hold 160-bit values and MÜST be held in TCPA-shielded locations. Further, these registers MUST be non-volatile (values are maintained during the power-off state). A TPM implementation need not provide the same number of DIRs as PCRs.

6.3 Operations Supporting Integrity Collection and Reporting

6.3.1 TPM_Extend

Type

TCPA protected capability.

Incoming Operands and Sizes

PAT	RAM	HMAC		Type Name	Description	
#	SZ	#	SZ	<i>"</i>		
1	2			TCPA_TAG	tag	TPM_TAG_RSP_COMMAND
2	4			UINT32	paramSize	Total number of output bytes including paramSize and lag
3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.
4	20			TCPA_PCRVALUE	outDigest	The PCR value after execution of the command.

Descriptions

TPM_Extend, TPM_SHA1CompleteExtend and TPM_Startup SHALL be the only commands that alter the value of any PCRs.

When TCPA_PERSISTENT_FLAG -> disable is TRUE, TPM_Extend SHALL update the target PCR but return zero instead of the new value of the PCR.

Actions

- 1. Create c1 by concatenating (PCR_{index} TCPA_PCRVALUE || inDigest). This takes the current PCR value and concatenates the inDigest parameter.
- 2. Create h1 by performing a SHA1 digest of c1.
- 3. Store h1 as the new TCPA_PCRVALUE of PCRindex
- 4. If TCPA_PERSISTENT_FLAG -> disable is TRUE
 - a. Set outDigest to 20 bytes of 0x00
- 5. Else
 - a. Set outDigest to h1

6.3.2 TPM_PcrRead

7. Protected Storage

Start: of informative comments:

Whis section introduces the processes by which a TPN may acres the portal to confidential cata store: or arbitrary storage media

ATPM is required to protect he veys that it encised. TRM identities and keys that are released only when the computing environment of the associated platform that a particular state. Given this capability if its a natural extension to enable a TRM to anote: arbitrary data and arbitrary keys. Unfortunately, this appropriately arbitrary data and arbitrary keys. Unfortunately, this appropriately arbitrary data and arbitrary in a TRM. The TRM is sessification therefore the transfer that enable a TRM to add as a social to contribute with both restrainments of contribution are obtained the TRM.

Storing data outside the IPM has the equitional advantages of enabling easter migration of confidential data from one platform to another and enabling accovery to confidential data in the event of clatform failure. These procedure storage enablilities are designed to enable the IPM to cooperate as a slave device so as the evolution cost computing patform. These capabilities are are designed to evolution the result of the IPM designed to confidential data that is stored outside the IPM. These design goals impose constraints on the victure of the procedurational capabilities.

The TGPA solution uses the TPM to generate thlobs of secret data. Unspecified capabilities ouside the Subsystem manage protected storage and issue certificates or other indications about the purpose and usefulness of data/keys held in blobs. Those unspecified capabilities issue commands to the TPM that cause that create blobs of data and to use and return the contents of such blobs. This unspecified functionality is the manager of protected storage and uses the TPM as a specialized co-processor. The protected storage and uses the TPM as a specialized co-processor. The protected storage commands are chosen to prevent subversion of the data in protected storage. Hence a regule management regulation can disrupt protected storage out cannot subvert it.

stored secret could be any of the following:

- Arbitrary defendrankey that secret/is enbluary deter it can be exported/from the TRM, and the TRM will not permit a secret is at key, this available for use within the TRM and will not a second and will never be experied from the TRM.
- An Songguna storege) keyjere sening key iliedkey isforendy ilon (kimes) ne be used to legine end vise verse. Snegvitor keys se used only to provide confidentality to sloos sentue keys are used for sening and lenv sets submitted by the enthy sulformed to use that key
- o The signature tray of a Text locality. Suar a signature kay vill be used only for special signific coerations:

slored seare the title following all flattes:

- ් i may be essable of moration to engine latious of il may be from inglation (see that side - කලාන්ත්වල ලෝගත් මේ ලෝග්ලාවේ ඔබුවේ රෙස ඉන්න්න්වා ල්ක්රීන් දුර්වන්ගත්ත්වේ දිපල ලෝග් - ලොක්ලිවෙන් වේ මගල්වන්ට ප්රතිශ්ණ ඉතිරිගත්
- o dinary de generaciónsos de TRV) o extensil, haded Extensily lesded keys cando de singlas O rocantensista a veys do rocytous reasons
- o ilitira) inevercesse control (A socie may ise eperatoral) processes on emparioradoril may no. wil Valvino degrees el controlina empera

Some of these attributes are partitioned as separate commands, while others are partitioned as flags within commands All the commands cause the IPAN to create a secretation and return the time called the hypersercommands causestine IPAN to import arbitop. Sometimes the TIPAN will then return the contents to the blob (data) to the caller and sometimes the TPA Hoads the contents of the blob (etkey) to suse within the TPA

In all cases, the ITPM invisicalizate contain the Keythat vill to use to either energinor ecoxyo the blood in all cases, the ITPM invisicalizate to a street to leave the modes contain an expetion (storage) keys that are used to energialized by a fine modes. I had algorithm, tile authorization flac is merely stored inside a blob, and the protected storage capabilities do not the madives interpretitionical

Tipe auth DataUsage field determines when authorization is required

The integrity of data or keys recovered from blobs is ensured by an implicit, rather than explicit mechanism. Ordinarily an integrity check is provided by appending a check-sum to original plaintext data. After decryption, the check-sum is recovered and compared with the check-sum in the recovered data. Such a check-sum needs to be at least 16 bytes long so as to have the necessary statistical properties, to the case of recovered closs the flist 20 bytes to authorization data are sufficient to determine with high probability, that data has been successfully decrypted without error. If the decrypton calls or the encrypted data contains errors it is unlikely that the authorization data in the recovered blob will match the submitted authorizationals.

The TPM also can be commanded to provide evidence that appropriedly public top is essorabled with a potentiable crivate top (which was generated by the TPM) and the noverbeen released busine the TPM). This is the TPM. Certifykey themoles at incorpany/to use a public text to energy case that can be recovered only using a protected supplied to the TPM. It is not that with the TPM and the new toes release to the TPM.

7.1 Introduction

7.1.1 Characteristics

នគរៈស៊ីម៉ាល់លាក់ប្រែ១ ១០៣៣ម៉ានេ

This seation specifies how to use the TIPM to provide seame storage for an infinite number of private keys of stranger care. Basteally, this is cone-timining the TRM to analysic desired by to the tranger of the trang

Radding and speed requirements make the IPM a very indicating nothing populate vehicle to do and bulk reproviding the desire secure as the desire secure was the would here seems software to desire any analysis of the make make an allowers of the make modules that imply requirements on the tunder of the make, as follows

- o Signing whice private key by the TPM can be accomplished only by presentation of authorization data to the tip tip tip the TPM that is associated with that private key. A private key generated by a third parity can be appropriately example the private key to the Contest of the TPM to troub with the consent of the USE of the TPM.
- c. Himust is abaro shift is a different to prove a specific initial, a long and a specific of the multiplication of the manner o
- o stimus notice possible for the Conter of a key, ever with the **concretio**n of the Owner of the TPM to impact a supposition of the Owner of the TPM to impact a supposition and the supposition is another. Since a key may be wrapped to islate the TPM, it is a possible that the TPM, it is not an open grapped by the possible to the Owner of a non-integrable asymmetric key, ever with cooperation of the Owner of the Owner of an energia and an analysical tribe and your the contents of an energia and analysical tribe when the asymmetric term and the analysical tribe and the owner asymmetric term.
- o lia ipMiscomptomsed ilunusimoleempionise all TPMs
- o Tio facilitate application fevel exchange of symmetric keys, the symmetric keys are stored using PK6S#1
- All this is generally accomplished as follows
- a Anydata insprotected storage is explicitly identified as impratable for non-migratable
- C. Lead TPV contains a SRK, generated by the TRV at the request of the Owner Unite (that SRK are type reas one dealing with integratable care another that cealing with non-interable date.
- C. The non-myrabile five as disely below the SRK. The intellion free is directly below a impation free is directly below the SRK. Teach node in a tree provides confidentially for the mode immediately isolowit. Obviously, all intermediate nodes in the fives must be enaryblon lays. Node in the monomination is exposed.

 In the monomination free must be generated by the TRM, otherwise trops intermediate nodes could be exposed.

Finally, some coservations

- o in the angrallon tree, only leaf modes should be evaluate to signific. This is because a signatura node (used outside the TPV) for signing, should never be used for encryption and hence exind be used to energy (other nodes thence damination align
- o Simbry, in a normigation ide only leferoles should be evalude to spring. Since normigalolenous musuni beingalei (beymus neverspoerodsjochie IPA sileredig nstelled unlig IPA).
- o Any nor-legimee in the nor-indecedentee must be generaled within the TPM encinever exposed outside the TPM. Any key tend inerce exert uprempatable (key) generated in suffer must be a cending key.
- o Any impralate tay can be imprated by altyons that owns any of its impralate ancestors. As a result in order to be supertual amprated by altyons the manufactory and supertually anyons but the owner of that transplated bases and supertual with a rotarn particle surage LQV.

 This grammed ingline user that unline althoracy to subsolve it with a rotarn particle surage LQV.

End of antiormative comments

7.1.2 Key Storage

The number of asymmetric keys that are storable via a TPM SHOULD be limited only by the volume of storage available to the platform.

The TPM SHALL ensure that the TCPA_PERSISTENT_FLAGS -> tmpProof field is only included on TPM internally generated non-migratable keys. The rationale is that the tmpProof field is confidential information and exposure of this information would lower the security of the system.

7.2 Mandatory Functions

Stantofinjormative comment

Every TSS NUST support these functions; some must be FPM; and all may be TPM. They are derived Trom three parameters

- k Istheseard stored data or as alkay?
- 2. (Is the secretigenerated internally or externally?
- 3 Is the seered bound to the distingtion of also to POPs.

7.2.1 TPM_Seal

Sei. രിന്ത് നല്യാരത്തെന്

Tine SEAL operation allows soliware to explicitly state the future trested teoritgulation that the platform must be the following the following that the platform invisible the secretaristic of the s

If the UNSEAL occuration subsects, proof to the platform configuration that was unclined when the SEAL coverable was performed is taurned to the caller as well as the secret data. This proof may for may not be of interest, if the SEALCOLEGIC bases is used to authenticate the partions to a thic party, a caller is normally deconcerned about the state of the platform when the seas was SEALCOLEGIC and treatment party to the other hand, if like SEALCOLEGIC is used to authenticate a third party to the platform of caller is portable continued as SEALCOLEGIC in the platform when the search was SEALCOLEGIC in the search was SEALCOLEGIC in the platform when the search was SEALCOLEGIC in the platform when the search was SEALCOLEGIC in the search was SEALCOL

For example, it SEAL is used to store a secial key for a litture configuration (oppositive) prove that the platform is a particular elation that is in a particular configuration) the only requirement is the unat key can be used only when the platform is include it in the configuration. Then there is no interest in the epartorn configuration when the second cay was SEALed. An example of this case is when SEAL is used to store a national configuration when the second cay was SEALed. An example of this case is when SEAL is used to store a national configuration by

On the other hand, suppose an OS contains an encrypted database of users allowed to log on to the platform. The OS uses at SEAUED blob to store the encryption key for the user database. However, the nature of SEAU is that any SW stack can SEAU a blob for any other software stack. Hence the los can be attacked by a second OS replacing both the SEAUED blob encryption key. **and the user database itself, allowing unituated pagies access to the services of the OS. **Jio thwart such attacks. SEAUED blobs include the past SW configuration. Hence, little OS is concerned about such attacks, it may check to see whether the past configuration is one that is known to be thusted.

TPM_Seal requires the encryption of one parameter ("Secret). For the sake of uniformity with other commends that require the encryption of more than encryption the String used for XOR encryption is generated by concatenating a nence (created suring the OSAP session) with the session shared secret and then hashing the result

ឱរថយនីលើខារានសែនខ្មែលភាពខារ

Type

TPM function; user must provide authorization to use the key pointed to by keyHandle.

7	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: key.usageAuth.

Descriptions

The string used for XOR encryption of the command variable named encAuth SHALL be the digest created by concatenating the shared session secret with the even numbered hash (generated by the TPM) and hashing the concatenated value.

TPM_Seal is used to encrypt private objects that can only be decrypted using TPM_Unseal.

Actions

- 1. If the inDataSize is 0 the TPM returns TCPA_BAD_PARAMETER
- If the keyUsage field of the key indicated by keyHandle does not have the value TPM_KEY_STORAGE, the TPM must return the error code TCPA_INVALID_KEYUSAGE.
- 3. If the keyHandle points to a migratable key then the TPM MUST return the error code TCPA_INVALID_KEY_USAGE.

- 4. The TPM_Seal command MUST fill in a TPM_STORED_DATA structure. This structure includes a properly filled in and encrypted TCPA_SEALED_DATA structure. The encryption key for the operation is the key pointed to by the keyHandle parameter.
- 5. The TPM MUST set the TPM_STORED_DATA -> ver to the current TPM version.
- 6. Create an XOR-string by concatenating the shared session secret with the even numbered hash (generated by the TPM) and hashing the concatenated value. Generate the plaintext authorization data for the sealed data by XORing the XOR-string with the variable encAuth.
- 7. Set continueAuthSession to FALSE.
- 8. If the data is wrapped to PCR's then
 - a. The TPM MUST check that the pcrinfo parameter is a consistent TCPA_PCR_SELECTION structure. If not, the TPM MUST return the error code TCPA_BADINDEX.
 - The TPM MUST compute a1 by creating TCPA_COMPOSITE_HASH value using pcrinfo
 pcrSelection as the input to the algorithm in 10.4.5.
 - c. The TPM MUST set TPM_STORED_DATA -> sealInfo -> digestAtRelease to pcrInfo -> digestAtRelease.
 - d. The TPM MUST set TPM_STORED_DATA -> SealInfo -> digestAtCreation to a1
 - e. The TPM MUST set TPM_STORED_DATA -> sealInfoSize to the size of the TCPA_PCR_INFO structure.

9. Else

- a. The TPM MUST set TPM_STORED_DATA -> sealInfoSize to 0.
- 10. The TPM provides no validation of the authorization data. Well known values like nulls are possible and allowed.
- 11. The TPM must ensure that the PAYLOAD_TYPE byte of any sealed data is set to the proper value to ensure that all encrypted elements can be distinguished from each other.

11	20			TCPA_AUTHDATA	dataAuth	The authorization digest used for the dataAuth session. HMAC key: entity.usageAuth.

Actions

- 1. The TPM MUST validate that parentAuth authorizes the use of the key in parentHandle. On failure the TPM MUST return TCPA_AUTHFAIL.
- If the keyUsage field of the key indicated by parentHandle does not have the value TPM_KEY_STORAGE, the TPM must return the error code TCPA_INVALID_KEYUSAGE.
- 3. The TPM MUST check that the TCPA_KEY_FLAGS -> Migratable flag has the value FALSE in the key indicated by parentKeyHandle. If not, the TPM MUST return the error code TCPA_BAD_PARAMETER.
- 4. The TPM MUST create d1 by decrypting inData using the key pointed to by parentHandle. inData is a TCPA_STORED_DATA structure and the encrypted area is pointed to by inData -> encData.
- The TPM MUST check the integrity of the d1. The integrity check establishes that the d1 is a consistent TPM_SEALED_DATA structure created with by a TPM_Seal operation on the same TPM that is attempting the TPM_Unseal and that d1 has not been modified.
 - a. The TPM MUST check that the d1 -> tpmProof matches TCPA_PERSISTENT_DATA -> tpmProof.
 - b. The TPM MUST calculate h1 by performing the same calculation that creates TPM_SEALED_DATA -> storedDigest.
 - c. The TPM MUST validate that h1 and d1 -> storedDigest match.
 - d. The TPM MUST check the TCPA_PAYLOAD_TYPE value and ensure that it is not decrypting a key.

- e. If d1 fails the integrity checks, then the operation MUST return the error TCPA_NOTSEALED_BLOB.
- 6. The TPM must validate the authorization to use d1. The TPM MUST validate the authorization in dataAuth matches the d1 -> authData parameter. The TPM MUST return TCPA_AUTHFAIL on a mismatch.
- 7. If inData is wrapped to PCR's then,
 - a. The TPM MUST ensure that the PCRs to which the blob was sealed are the same as the PCRs' values that exist at the time of TPM_Unseal.
 - b. The TPM MUST validate that inData -> pcrInfo is a valid TCPA_INFO_STRUCTURE.
 - c. The TPM will create h1 by computing a composite hash using the inData -> pcrInfo parameter as the input to the composite hashing algorithm (See 10.4.5).
 - d. The TPM MUST compare h1 with inData -> pcrInfo -> digestAtRelease. On a mismatch the TPM MUST return TCPA_WRONGPCRVALUE.
- 8. else
- a. The TPM does not need to check PCR configuration.

7.2.3 TSS_Bind

Seidofilinoimalive comment

The TSS Bind command allows on order ourside of the TPM to create a labor that cambe operated or day TRM. Unabled

The TSS Bind commend is responsible for creating the block to be encrypted in a manner that is decryptable by TPN_Uniting

8	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: key.usageAuth.

Description

UnBind SHALL operate on a single block only.

Actions

The TPM SHALL perform the following:

- If the inDataSize is 0 the TPM returns TCPA_BAD_PARAMETER
- 2. Validate the authorization to use the key pointed to by keyHandle
- If the keyUsage field of the key referenced by keyHandle does not have the value TPM_KEY_BIND or TPM_KEY_LEGACY, the TPM must return the error code TCPA_INVALID_KEYUSAGE
- 4. Decrypt the inData using the key pointed to by keyHandle
- 5. if (keyHandle -> encScheme does not equal TCPA_ES_RSAESOAEP_SHA1_MGF1) and (keyHandle -> keyUsage equals TPM_KEY_LEGACY),
 - The payload does not have TCPA specific markers to validate, so no consistency check can be performed.
 - b. Set the output parameter outData to the value of the decrypted value of inData. (Padding associated with the encryption wrapping of inData SHALL NOT be returned.)
 - c. Set the output parameter outDataSize to the size of outData, as deduced from the decryption process.
 - Return the output parameters.

6. else

- a. Interpret the decrypted data under the assumption that it is a TCPA_BOUND_DATA structure, and validate that the payload type is TCPA_PT_BIND
- b. Set the output parameter outData to the value of TCPA_BOUND_DATA -> payloadData. (Other parameters of TCPA_BOUND_DATA SHALL NOT be returned. Padding associated with the encryption wrapping of inData SHALL NOT be returned.)
- c. Set the output parameter outDataSize to the size of outData, as deduced from the decryption process and the interpretation of TCPA_BOUND_DATA.

d. Return the output parameters.

6	1	4 H1	1	BOOL	continueAuthSession	Continue use flag, fixed at FALSE
7	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: parentKey.usageAuth.

Descriptions

This command requires the encryption of two parameters. To create two XOR strings the caller combines the two nonces in use by the OSAP session with the session shared secret.

DataUsageAuth is XOR'd with the SHA-1 hash of the concatenation of the OSAP session shared secret with the even numbered nonce generated by the TPM (authLastNonceEven). MigrationAuth is XOR'd with the SHA-1 hash of the concatenation of the OSAP session shared secret with the odd numbered nonce generated by the caller (nonceOdd).

Actions -

The TPM SHALL do the following:

- 1. Validate the authorization to use the key pointed to by parentHandle. Return TCPA_AUTHFAIL on any error.
- 2. Validate the session type for parentHandle is OS-AP.
- 3. Verify that parentHandle->keyUsage equals TPM_KEY_STORAGE
- 4. If parentHandle -> keyFlag -> migratable is TRUE and keyInfo -> keyFlag -> migratable is FALSE then return TCPA_INVALID_KEYUSAGE
- 5. Validate key parameters
 - a. keyInfo -> keyUsage MUST NOT be TPM_KEY_IDENTITY or TPM_KEY_AUTHCHANGE. If it is, return TCPA_BAD_PARAMETER.
 - b. If keyInfo -> keyUsage equals TPM_KEY_STORAGE
 - i. algorithmID MUST be TCPA_ALG_RSA
 - ii. encScheme MUST be TCPA_ES_RSAESOAEP_SHA1_MGF1
 - iii. sigScheme MUST be TCPA_SS_NONE
 - iv. key size MUST be 2048
- 6. Validate all keyInfo parameters, any errors return TCPA_BAD_PARAMETER
- 7. Create the two XOR patterns by using the session key and the nonces for this transaction

- 8. Set continueAuthSession to FALSE
- 9. Decrypt the DataUsageAuth and DataMigrationAuth parameters
- 10. Generate asymmetric key according to algorithm information in keyInfo
- 11. Fill in the wrappedKey structure with information from the newly generated key.
 - a. Set the auth member of this structure to the decrypted values of DataUsageAuth.
 - b. The TPM MUST set the wrappedKey -> ver to the current TPM version.
 - c. If the KeyFlags -> migratable bit is set to 1, the wrappedKey -> encData -> migrationAuth SHALL contain the decrypted value from DataMigrationAuth.
 - d. If the KeyFlags -> migratable bit is set to 0, and wrappedKey -> encData -> migrationAuth SHALL be set to the value tpmProof.
- 12. Encrypt the private portions of the wrappedKey structure using the key in keyHandle
- 13. Return the newly generated key in the wrappedKey parameter

7.2.6 TSS_WrapKey

Starkoffinformative comment

The TISS Witholder, command creates a interestable blooder in they that has been presented externally the creator of the key contributed integration by the User by wrapping thyth a donating palable storage key and loading for the Migration Authorization Date. However, the internal off will still be select integrable. This allows delegation of a Key Without giving the delegator the tight to further delegate because the key was created elsewhere. There is no meed to nature the Buskey of the key to include wrapped and because a public key is used to delegate to the TIPM, there is no need to apply the the transfer in meed to apply the transfer in the selection dates we have a public key is used to delegate the delegate the transfer of the warping external to the TIPM, there is no need to apply the transfer of the warping of the transfer o PERECEIPED IN VERVIENTE OF THE CONTROL FOR THE POPULATION OF THE CONTROL FOR THE CONTROL FROM T

End of informative comment

Actions

The TSS SHOULD do the following:

- 1. If the keyUsage field of PubKey does not have the value TPM_KEY_STORAGE, the TSS must return the error code TCPA_INVALID_KEYUSAGE
- Validate the TCPA_STORE_ASYMKEY structure
- Fill in the TCPA_STORE_ASYMKEY structure with the authorization and usage parameters
- 4. Set KeyFlags.migratable to 1
- Set all other KeyFlags members to the values in KeyFlags parameter
- Set TCPA_STORE_ASYMKEY.pcrDigest to 20 bytes of value 0xFF.
- Encrypt the TCPA_STORE_ASYMKEY structure using the pubkey parameter
- Return the entire TCPA_KEY structure

7.2.7 TSS_WrapKeyToPcr

Starkofiniormative comment

The TISS WrapkeyToPer comment is sindle to the TISS Wedkey comment except that I has an additional requirement for exthorization of users PCR value must make the value given at blob-oreation time. Thus, TISS WrapkeyTroPer prestes a migratable blob for a key that has been presented externally. Both authorization requirement.

Actions

The TSS SHOULD do the following:

- 1. If the keyUsage field of PubKey does not have the value TPM_KEY_STORAGE, the TSS must return the error code TCPA_INVALID_KEYUSAGE
- 2. Validate the TCPA_STORE_ASYMKEY structure
- 3. Fill in the TCPA_STORE_ASYMKEY structure with the authorization and usage parameters
- 4. Set KeyFlags.migratable to 1
- 5. Set all other KeyFlags members to the values in KeyFlags parameter
- 6. Set TCPA_STORE_ASYMKEY.pcrDigest to TargetPCRHash
- 7. Encrypt the TCPA_STORE_ASYMKEY structure using the pubkey parameter
- 8. Return the entire TCPA_KEY structure

7.2.8 TPM_LoadKey

San of mornalive comment

Before the TIPM can use a key to either was; unwas, bind walled seet unseat sign of perform any other astron it inecess to be present in the TIPM. The TIPM_Leadkey function tooks the key into the TIPM in fulfrer use.

The TPM assigns the key francie. The TPM alveys locates a located key by use of the handle. The assumption is that the handle may draigle due to key management operations, it is the responsibility of agent level software to metalant the majoring between handle and any label used by external software.

नित्र किता कातत्त्वात त्त्राम्य त्त्रामाना र प्रथमित कार्यकात कार्यकात है। स्वर्थन स्वर्थन स्वर्थन विकास स्वर् कित्र २९८२ स्वर्भन्ति कार्यनिष्ठितिस्तार

inds commend has the responsibility of citioning restrictions on the use of text. For example, when attempting to load a STORASE vay (Lvill be caseded for the restrictions on a storage key (2046 size (664)

The flag perent? CRS tatus enables the cossibility of streaking that a platform trassed thirough some particular state or states before mishing in the current state. A grandparent key could be trakeful estate it a parent key could tinked to state 2, and a shill key could be flinked to state 3, for example. The user the child key then indicates that the platform passed through states 1 and 2 and 4s currently in state 3, it this example. The issue of TIPM. Standup is with strive # TISPA_ST_GLEAR is an indication that the platform has been tress, so the platform has not passed through the previous states. Hence keys with parentPGR status # TRUE must be unloaded if TPM_Standup is issued with strype # TISPA_ST_GLEAR.

If a TIGPA. KEY structure has been decrypted AND the Integrity test using "pubbataDiges!" has passed AND the key is non-integratory, the key must have been created by the TPM. So there is every reason to believe that the key poses no security threat to the TPM. While there is no known attack from a reque integratory key, there is a desire to verify that a loaded integratory key is a real key, arising from a general sense of unease about execution of arbitrary data as a key ideally a consistency direct would consist of an energy of decrypt, cycle, out this may to expensive from RSA keys. It is therefore suggested that the consistency test consists of dividing the supposed RSA product by the supposed RSA prime, and directing that there is no remainder.

Actions 4 1

The TPM SHALL perform the following steps:

- 1. Validate the authorization to use the key in parentHandle
- 2. If the keyUsage field of the key referenced by parent handle does not have the value TPM_KEY_STORAGE, the TPM must return the error code TCPA_INVALID_KEYUSAGE
- 3. Decrypt the inKey -> privkey to obtain TCPA_STORE_ASYMKEY structure using the key in parentHandle
- 4. Validate the integrity of inKey and decrypted TCPA_STORE_ASYMKEY
 - a. Reproduce inKey -> TCPA_STORE_ASYMKEY -> pubDataDigest using the fields of inKey, and check that the reproduced value is the same as pubDataDigest
- 5. Validate the consistency of the key and it's key usage.
 - a. If inKey -> keyFlags -> migratable is TRUE, the TPM SHALL verify consistency of the public and private components of the asymmetric key pair. If inKey -> keyFlags -> migratable is FALSE, the TPM MAY verify consistency of the public and private components of the asymmetric key pair. The consistency of an RSA key pair MAY be verified by dividing the supposed (P*Q) product by a supposed prime and checking that there is no remainder ...
 - b. If inKey -> keyUsage is TPM_KEY_IDENTITY, verify that inKey->keyFlags->migratable is FALSE. If it is not, return TCPA_BAD_PARAMETER
 - c. If inKey -> keyUsage is TPM_KEY_AUTHCHANGE, return TCPA_BAD_PARAMETER
 - If inKey -> keyFlags -> migratable equals 0 then verify that TCPA_STORE_ASYMKEY -> migration equals TCPA_PERSISTENT_DATA -> tpmProof
 - e. Validate the mix of encryption and signature schemes according to section 4.10.1

f. If inKey -> keyUsage is TPM_KEY_STORAGE

- i. algorithmID MUST be TCPA_ALG_RSA
- ii. Key size MUST be 2048
- iii. sigScheme MUST be TCPA_SS_NONE

g. If inKey -> keyUsage is TPM_KEY_IDENTITY

- i. algorithmID MUST be TCPA_ALG_RSA
- ii. Key size MUST be 2048
- iii. encScheme MUST be TCPA_ES_NONE

h. If the decrypted inKey ->pcrinfo is not NULL,

- i. The TPM validates that inKey -> pcrInfo -> pcrSelection points to at least one PCR register. If no PCR registers are selected the TPM MUST NOT perform any further checks regarding PCR registers with the loaded key.
- ii. The TPM MUST store the list of active PCR registers in a manner that allows the TPM to access this list whenever the loaded key is used for any function.
- iii. Every time before the loaded key is used, the inkey -> PCRInfo structure from TPM_LoadKey MUST be used to verify that the current PCR state is correct. The TPM MUST ensure that the PCRs to which the key was sealed are the same as the PCRs' values that exist at the time of key usage. To do this, the TPM will compute a TCPA_COMPOSITE_HASH value using the inkey -> pcrInfo -> pcrSelection -> pcrSelect parameter as the input to the composite hashing algorithm (See 10.4.5).
- iv. If the resulting composite hash matches the inkey -> PCRInfo -> digestAtRelease parameter, the TPM is permitted to use the key. Otherwise, if the composite hashes do not match, the TPM is NOT permitted to use the key in the current PCR state, and the TPM MUST return TCPA_WRONGPCRVAL.

i. If the decrypted inKey -> pcrlnfo is NULL,

- i. The TPM MUST set the internal indicator to indicate that the key is not using any PCR registers.
- 6. Perform any processing necessary to make TCPA_STORE_ASYMKEY key available for operations
- 7. Load key and key information into internal memory of the TPM. If insufficient memory exists return error TCPA_NOSPACE.
- 8. Assign inKeyHandle according to internal TPM rules.
- 9. Set InKeyHandle -> parentPCRStatus to parentHandle -> parentPCRStatus.
- 10. If ParentHandle indicates it is using PCR registers then set inKeyHandle -> parentPCRStatus to TRUE. The TPM creates an indicator of PCR usage in step 5.h.ii above. This indicator is internal to the TPM but MUST accurately reflect the sealing of a key to a PCR register.

7.2.9 TPM_EvictKey

Type

TPM command. Non-authorized.

13	20			TCPA_AUTHDATA	entityAuth	The authorization digest for the returned parameters and entity. HMAC key: entity.migrationAuth.

Description

The key that wraps the migration key MUST be a 2048 bit RSA key or higher.

The TPM does not check the PCR values when migrating values locked to a PCR.

The second authorisation session (using entityAuth) MUST be OIAP because OSAP does not have a suitable entityType

Actions

- Validate that parentAuth authorizes the use of the key pointed to by parentHandle.
- 2. Create d1 by decrypting encData using the key pointed to by parentHandle.
- 3. Validate that entityAuth authorizes the migration of d1. The validation MUST use d1 -> migrationAuth as the secret.
- Verify that the digest within migrationKeyAuth is legal for this TPM and public key
- 5. If migrationType == TCPA_MS_MIGRATE the TPM SHALL perform the following actions:
 - Build a TCPA_STORE_PRIVKEY structure from the d1 key. This privKey element should be 132 bytes long for a 2K RSA key.
 - b. Create k1 and k2 by splitting the privKey element created in step a into 2 parts. k1 is the first 20 bytes of privKey, k2 contains the remainder of privKey.
 - c. Build m by filling in the usageAuth and pubDataDigest fields within a TCPA_MIGRATE_ASYMKEY structure using data from the d1 key. The privKey field should be set to k2 (step g) and payload should be set to TCPA_PT_MIGRATE.
 - d. Create o1 (which SHALL be 198 bytes for a 2048 bit RSA key) by performing the OAEP encoding of m using OAEP parameters of
 - i. m = TCPA_MIGRATE_ASYMKEY structure (step c)
 - ii. pHash = d1->migrationAuth
 - iii. seed = s1 = k1 (step g)
 - e. Create r1 a random value from the TPM RNG. The size of r1 MUST be the size of o1. Return r1 in the Random parameter.
 - f. Create x1 by XOR of o1 with r1
 - g. Copy r1 into the output field "random".
 - h. Encrypt x1 with the migration public key included in migrationKeyAuth.
- 6. If migrationType == TCPA_MS_REWRAP the TPM SHALL perform the following actions:
 - Rewrap the key using the public key in migrationKeyAuth, keeping the existing contents of that key.
 - b. If randomSize is 0 the TPM returns TCPA_BAD_PARAMETER.

7.2.12 TPM_ConvertMigrationBlob

Sar omorphice commen

Tins command takes a migration such and organiss a mornal waspect blos. The migrated such must be Teader into the TRM with the reasons TRM. Leading victorities

Note that the command interiors only it is included the command interior of the associated public tays is not specified by 170PA because they are not security sensitive. Migration of the associated public tays may be specified in a platform specific appointed to ATCPA KEY structure much be recreated before the interior tay resulter used by the larget TPM in a decidely command.

7 20 TCPA_AUTHDATA resAuth The authorization digest for the returned parameters. HMAC key: ownerAuth.	7	20	TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: ownerAuth.
---	---	----	---------------	---------	---

Action

The TPM SHALL perform the following:

- 1. Validate the authorization to use the TPM by the TPM Owner
- 2. Create a f1 a TCPA_MIGRATIONKEYAUTH structure
- 3. Set f1 -> migrationKey to the input migrationKey
- 4. Set f1 -> migrationScheme to the input migrationScheme
- 5. Create v1 by concatenating (migrationKey || migrationScheme || TCPA_PERSISTENT_DATA -> tpmProof)
- 6. Create h1 by performing a SHA1 hash of v1
- 7. Set f1 -> digest to h1
- 8. Return f1 as outData

7.3 TPM Optional Functions: Maintenance

Staraojaniormalive.commente

Maintenance is different from backup/migration, leasure maintenance povides for the integration of both integration of both integration, distriction, but if a THM, chaptes maintenance, the inclinitenance capabilities in this specification are maintenance, as other integration capabilities are this specification are maintenance of as other integration capabilities small be used, Maintenance necessarily involves its manufacturer of a Subsystem.

When maintaining computer systems, title sometime the case that a manufacture of its representative needs to replace a Subsystem containing a TRM. Some manufactures consider it a requirement that there to a means of doing this replacement without the loss of the notering atable tays that tay the original TRM.

්මුල ගොලා අලට අපවස ම්' බිලිවරු ලෙස්ලාණය එයෙන් සියහ්සාලය එක් 'the Cete within ඉන්නෙන් යුග්සලය අ අත්ලායයා ඉන්නෙන් අදවාසේ ආල්යයන් මෙන් මෙන් නියේ සියහ්සාලය එක් 'the Cete within ඉන්නෙන්

Endrol informative comments

Any migration of non-migratory data protected by a Subsystem SHALL require the cooperation of both the Owner of that non-migratory data and the manufacturer of that Subsystem. That manufacturer SHALL NOT cooperate in a maintenance process unless the manufacturer is satisfied that non-migratory data will exist in exactly one Subsystem. A TPM SHALL NOT provide capabilities that support migration of non-migratory data unless those capabilities are described in the TCPA specification.

The maintenance feature MUST move the following

- TCPA_KEY for SRK. The maintenance process will reset the SRK authorization to match the TPM Owners authorization
- TCPA_PERSISTENT_DATA -> tpmProof
- · TPM Owners authorization

2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4	1s	4	TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.
		2s	4	TCPA_COMMAND_CODE	ordinal	Cmd ordinal: TPM_ORD_CreateMaintenanceArchive
4	4	3s	4	UINT32	randomSize	Size of the returned random data. Will be 0 if generateRandom is FALSE.
5	0	4s	Ø	BYTE[]	random	Random data to XOR with result.
6	4	5s	4	UINT32	archiveSize	Size of the encrypted archive
7	Ø	6s	Ø	BYTE []	archive	Encrypted key archive.
8	20	2 н1	20	TCPA_NONCE	nonceEven	Even nonce newly generated by TPM to cover outputs
		3 н1	20	TCPA_NONCE	nonceOdd	Nonce generated by system associated with authHandle
9	1	4 н1	1	BOOL	continueAuthSession	Continue use flag, TRUE if handle is still active
10	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: ownerAuth.

Actions

Upon authorization being confirmed this command does the following:

- 1. Validates that the TCPA_PERSISTENT_FLAGS -> AllowMaintenance is TRUE.
- 2. Validates the TPM Owner authorization.
- 3. If the value of TCPA_PERSISTENT_DATA -> ManuMaintPub is zero, the TPM MUST return the error code TCPA_KEYNOTFOUND
- 4. Build a1 a TCPA_KEY structure using the SRK. The encData field is not a normal TCPA_STORE_ASYMKEY structure but rather a TCPA_MIGRATE_ASYMKEY structure built using the following actions.
- 5. Build a TCPA_STORE_PRIVKEY structure from the SRK. This privKey element should be 132 bytes long for a 2K RSA key.
- 6. Create k1 and k2 by splitting the privKey element created in step 4 into 2 parts. k1 is the first 20 bytes of privKey, k2 contains the remainder of privKey.
- 7. Build m1 by creating and filling in a TCPA_MIGRATE_ASYMKEY structure
 - a. m1 -> usageAuth is set to TCPA_PERSISTENT_FIELDS -> tmpProof
 - b. m1 -> pubDataDigest is set to the digest value of the SRK fields from step 4
 - c. m1 -> payload is set to TCPA_PT_MAINT
 - d. m1 -> partPrivKey is set to k2
- 8. Create o1 (which SHALL be 198 bytes for a 2048 bit RSA key) by performing the OAEP encoding of m using OAEP parameters of
 - a. m = TCPA_MIGRATE_ASYMKEY structure (step 7)
 - b. P = TCPA_PERSISTENT_FIELDS -> ownerAuth
 - c. seed = s1 = k1 (step 6)

9. If GenerateRandom = TRUE

a. Create r1 by obtaining values from the TPM RNG. The size of r1 MUST be the same size as o1. Set RandomData parameter to r1

10. If GenerateRandom = FALSE

- a. Create r1 by applying MGF1 to the TPM Owner authorization data. The size of r1 MUST be the same size as o1. Set RandomData parameter to null.
- 11. Create x1 by XOR of o1 with r1
- 12. Encrypt x1 with the ManuMaintPub key using the TCPA_ES_RSAESOAEP_SHA1_MGF1 encryption scheme.
- 13. Set a1 -> encData to x1
- 14. Return a1 in the archive parameter

7.3.2 TPM_LoadMaintenanceArchive

•	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: ownerAuth.

Descriptions

The maintenance mechanisms in the TPM MUST not require the TPM to hold a global secret. The definition of global secret is a secret value shared by more than one TPM.

The TPME is not allowed to pre-store or use unique identifiers in the TPM for the purpose of maintenance. The TPM MUST NOT use the endorsement key for identification or encryption in the maintenance process. The maintenance process MAY use a TPM Identity to deliver maintenance information to specific TPM's.

The maintenance process can only change the SRK, tpmProof and TPM Owner authorization fields.

The maintenance process can only access data in shielded locations where this data is necessary to validate the TPM Owner, validate the TPME and manipulate the blob

The TPM MUST be conformant to the TCPA specification, protection profiles and security targets after maintenance. The maintenance MAY NOT decrease the security values from the original security target.

The security target used to evaluate this TPM MUST include this command in the TOE.

Actions

The TPM SHALL perform the following when executing the command

- 1. Validate the TPM Owner's authorization
- 2. Validate that the maintenance information was sent by the TPME. The validation mechanism MUST use a strength of function that is at least the same strength of function as a digital signature performed using a 2048 bit RSA key.
- 3. The packet MUST contain m2 as defined in 7.3.1
- 4. Ensure that only the target TPM can interpret the maintenance packet. The protection mechanism MUST use a strength of function that is at least the same strength of function as a digital signature performed using a 2048 bit RSA key.
- 5. Process the maintenance information and update the SRK and TCPA_PERSISTENT_DATA -> tpmProof fields.
- 6. Set the SRK useageAuth to be the same as TPM Owners authorization

7.3.3 TPM_KillMaintenanceFeature

				TCPA_COMMAND_CODE	ordinal	Command ordinal: TPM_ORD_LoadManuMain(Pub
4	20			TCPA_DIGEST	checksum	. Digest of pubKey and antiReplay

Type

Optional; TCPA protected capability

Description

The pubKey MUST specify an algorithm whose strength is not less than the RSA algorithm with 2048bit keys.

pubKey SHOULD unambiguously identify the entity that will perform the maintenance process with the TPM Owner.

TCPA_PERSISTENT_DATA -> ManuMaintPub SHALL exist in a TCPA-shielded location, only.

If an entity (Platform Entity) does not support the maintenance process but issues a platform credential for a platform containing a TPM that supports the maintenance process, the value of TCPA_PERSISTENT_DATA -> ManuMaintPub MUST be set to zero before the platform leaves the entity's control.

Actions

The first valid TPM_LoadManuMaintPub command received by a TPM SHALL

- 1. Store the parameter pubKey as TCPA_PERSISTENT_DATA -> ManuMaintPub.
- 2. Create "checksum" by concatenating data to form (pubKey||antiReplay) and passing the concatenated data through a SHA-1 hash process.
- 3. Export the checksum

Subsequent calls to TPM_LoadManuMaintPub SHALL return code TCPA_FAIL.

7.3.5 TPM_ReadManuMaintPub

Informative Comments

The IReadManulMannique command is used to obed, whether the manulacturers qualternaintenance key It is IFPM has the expected value, This may be useful sumporthe manulacture arcoess. 11	1	4 H2	1	BOOL	continueKeyAuthSession	Continue use flag for larget key session
12	20			TCPA_AUTHDATA	keyAuth	The authorization digest for the target key. HMAC key: key.auth.

Actions

- 1. The TPM validates that the key pointed to by certHandle has a signature scheme of TCPA_SS_RSASSAPKCS1v15_SHA1.
- 2. The TPM verifies the authorization in certAuthHandle provides authorization to use the key pointed to by certHandle.
- 3. The TPM verifies the authorization in keyAuthHandle provides authorization to use the key pointed to by keyHandle.
- 4. If the key pointed to by certHandle is an identity key (certHandle:TCPA_KEY -> keyUsage is TPM_KEY_IDENTITY), the TPM verifies that the key pointed to by keyHandle is a non-migratory key.
- The TPM SHALL create a c1 a TCPA_CERTIFY_INFO (defined in section 4.28) structure from the key pointed to by keyHandle.
- 6. The TPM calculates the digest of the (public key) keyHandle -> pubKey -> key and stores it in the c1 > pubkeyDigest.

- 7. The TPM copies the antiReplay parameter to the TCPA_CERTIFY_INFO c1 -> data.
- 8. If pcrinfoSize is not 0 for the key pointed by keyHandle,
 - a. The TPM MUST set c1 -> pcrlnfoSize to match the pcrlnfoSize from the keyHandle key.
 - b. The TPM MUST set c1 -> pcrinfo to match the pcrinfo from the keyHandle key.
 - c. The TPM MUST set c1 -> digestAtCreation to 20 bytes of 0x00.
- 9. If pcrinfoSize is 0 for the key pointed to by keyHandle
 - a. The TPM MUST set c1 -> pcrInfoSize to 0
- 10. The TPM creates m1, a message digest formed by taking the SHA1 of c1.
- 11. The TPM then performs a signature using certHandle -> sigScheme. The resulting signed blob is returned in outData.

8.4 TPM Internal Asymmetric Encryption

Starkoʻrini oʻrnative Gommente

For asymmetric responsion schemes are TPM is not required to performative blocking of unformation where that subjournation scannor be consysted in Let single covalographic coordina. The schemes are proposed in Let subjournation scannor be controlled in the schemes are proposed to any single block energiation. When using these schemes the called the TRM must controlled in any blocking and visible in course the subject of the TRM is a first responsibility of the called to ensure that any line block are proposity protected using a characterism.

Note the share are inverent eargers associated with splitting information so that it can be encrypted in multiple blocks with an asymmetric key, and then chaming together these blocks together. For example, if an integrity dreak incomers in a subject of a stacker can encrypt its own care using ine souble key, and extensive the integrity dreak incomers being ine souble key, and extensive the integrity dreak income block in larger of the original blocks in the message, thus foreign the TRM is replaced as of the message upon decryption.

There is also a more sublecatery to discover the data encrypted in for tentropy tologic. The attended trakes a cuess at the plaintext data catery is the substitues the encrypted guess for the original block. When the TRN decrypts the complete message is successful decryption will indicate that his guess was confed

These are a figuritar of solutions which resid be considered for this problem.— One such solution for TPMs supporting symmetric encryption is specified in PKGS#7, section 40, and involves using the public keyto encrypt a symmetric key (then using that symmetric key to encrypt the long message.

For TRMs. Wilhoutesymmetric encryption capabilities, an falternative solution may be to radd nandom padding to each message block thus increasing the blocks entropy.

End of informative comment

The TPM MUST check that the encryption scheme defined for use with the key is a valid scheme for the key type, as follows:

Key algorithm	Approved schemes	Scheme Value
TCPA_ALG_RSA	TCPA_ES_NONE	0×0001
	TCPA_ES_RSAESPKCSv15	0x0002
	TCPA_ES_RSAESOAEP_SHA1_MGF1	0×0003

For a TPM_UNBIND command where the parent key has pubKey.algorithmId equal to TCPA_ALG_RSA and pubKey.encScheme set to TCPA_ES_RSAESPKCSv15 the TPM SHALL NOT expect a PAYLOAD_TYPE structure to pre-pend the decrypted data.

The TPM MUST perform the encryption or decryption in accordance with the specification of the encryption scheme, as described below.

When a null terminated string is included in a calculation, the terminating null SHALL NOT be included in the calculation.

8.4.1 TCPA_ES_RSAESOAEP_SHA1_MGF1

The encryption and decryption MUST be performed using the scheme RSA_ES_OAEP defined in [PKCS #1v2.0: 8.1] using SHA1 as the hash algorithm for the encoding operation.

1. Encryption

- a. The OAEP encoding P parameter MUST be the NULL terminated string "TCPA".
- b. If there is an error with the encryption the TPM must return the error TCPA_ENCRYPT_ERROR.

2. Decryption

- a. The OAEP decoding P parameter MUST be the NULL terminated string "TCPA".
- b. If there is an error with the decryption, the TPM must return the error TCPA_DECRYPT_ERROR.

8.4.2 TCPA_ES_RSAESPKCSV15

The encryption MUST be performed using the scheme RSA_ES_PKCSV15 defined in [PKCS #1v2.0: 8.1].

1. Encryption

a. If there is an error with the encryption, return the error TCPA_ENCRYPT_ERROR.

2. Decryption

a. If there is an error with the decryption, return the error TCPA_DECRYPT_ERROR.

8.5 TPM Internal Digital Signatures

Stankoʻrintormativaccomment: Phese values ingleate the approved schemes in use by the TBM to generate digital signatures. Engrotantormativa comment:

The TPM MUST check that the signature scheme defined for use with the key is a valid scheme for the key type, as follows:

Key algorithm	Approved schemes	Scheme Value
TCPA_ALG_RSA	TCPA_SS_NONE	0x0001
	TCPA_SS_RSASSAPKCS1v15_SHA1	0x0002
	TCPA_SS_RSASSAPKCS1v15_DER	0x0003

The TPM MUST perform the signature or verification in accordance with the specification of the signature scheme, as described below.

8.5.1 TCPA_SS_RSASSAPKCS1v15_SHA1

The signature MUST be performed using the scheme RSASSA-PKCS1-v1.5 defined in [PKCS #1v2.0: 8.1] using SHA1 as the hash algorithm for the encoding operation.

8.5.2 TCPA_SS_RSASSAPKCS1v15_DER

The signature MUST be performed using the scheme RSASSA-PKCS1-v1.5 defined in [PKCS #1v2.0: 8.1]. The caller must properly format the area to sign using the DER rules. The provided area maximum size is k-11 octets.

8.6 HMAC Calculation

Start of Informative comment

ithe HMAC provides two pleass of information for the IPM, proof of knowledge of the authorization can and proof that the request emplify is authorized and thas no modifications made to the command in Iransi

The AMAS definition is for the AMAS calculation only. It does not specify the order of mechanism that transports the calculation realier to eather TPM.

The area for the MAC is order dependent. Each dominand has spedictions that each portions of the MAC reaction for the exclusive reactions are swith the cettain for the market exclusive exclusives as a MAC.

RFC 2:104 regiones tressentation of two parameters to properly define the AtMAC invest. These values are tressey length and tresposit size. This specification will use at key fenging it 20 Joyles and a folial size of XII bytes, These values are known in the IRFC as Koortherkey length and B as the tolook size.

The basic constituens

HIK XOR opad th K XOR Toad receive

where

- Hathe SHAT hash operation
- : K≘ithe key or the authorization data
- XOR=theXOR operation
- opad=the byte 0x5C repeated B times
- o. Bethebooklengh
- Inac = the byte 0x86 repeated 8 times
- ansampos salkmonkas semsagyus ora nousmonnogezeen salksixek

Endrol informative comment

The TPM MUST support the calculation of an HMAC according to RFC 2104.

The size of the key (K in RFC 2104) MUST be 20 bytes. The block size (B in RFC 2104) MUST be 64 bytes.

The order of the parameters is critical to the TPM's ability to recreate the HMAC. Not all of the fields are sent on the wire for each command for instance only one of the nonce values travels on the wire. The order of the parameters is set by section 4.4.

Each function indicates what parameters are involved in the HMAC calculation.

8.7 Digital Signatures

8.7.1 TPM_Sign

8 20 TCPA_AUTHDATA resAuth I he authorization digest for the returned parameters HMAC key: key.usageAuth	PA_AUTHDATA resAuth The authorization digest for the returned parameters. HMAC key: key.usageAuth
--	---

Description

The TPM MUST support all values of areaToSignSize that are legal for the defined signature scheme and key size. The maximum value of areaToSignSize is determined by the defined signature scheme and key size. In the case of PKCS1v15_SHA1 the areaToSignSize MUST be TCPA_DIGEST (the hash size of a sha1 operation - see 8.5.1 TCPA_SS_RSASSAPKCS1v15_SHA1). In the case of PKCS1v15_DER the maximum size of areaToSign is k-11 octets, where k is limited by the key size (see 8.5.2 TCPA_SS_RSASSAPKCS1v15_DER).

Actions

- 1. If the areaToSignSize is 0 the TPM returns TCPA_BAD_PARAMETER.
- 2. The TPM validates the authorization to use the key pointed to by keyHandle.
- Validate that keyHandle -> keyUsage is TPM_KEY_SIGN or TPM_KEY_LEGACY, if not return the error code TCPA_INVALID_KEYUSAGE
- 4. The TPM verifies that the signature scheme used by the key referenced by keyHandle is a valid and supported signature scheme.
- 5. The TPM verifies that the signature scheme and key size can properly sign the areaToSign parameter.
- 6. The TPM computes the signature, sig, using the key referenced by keyHandle, using with areaToSign as the information to be signed

8.7.2 TSS_VerifySignature

Stara o anto mative comments

WellySignature: takes a mash and verifies the digital signature of the hash. VerifySignature only returns a MRUE for FALSE answer. The callet does not receive any apiornation as to the reason for a failure.

The population of retining say end chiereston is especially important to: TPMs that implement TSS Verlassinature as operations of the TPM

Actions

The TPM updates the state of the current RNG using the appropriate mixing function.

8.9 Self Test

Star of informative comments

The stellates respondings enarcesigned to enable the rotestor of a TGRA obtaining with minimum leterary due to TRA selfates, that the possible to evolve resing time, weiting for a TRA to do selfate, by designing supplations where TRA selfatesing is done in perallal with other system strongers, at any ma when TRA regardablices are not required.

At serion, a TPM automatically tests and albose thromal functions district are associated on anther TPM consistency and the last of those entires thromal functions district as soon as possible arise serious framenting TPM capabilities are additional intended traditions that must be tested before the remaining TPM capabilities can execute A test of the additional functions can be explicitly called Alternatively those functions will automatically octasted prior to execution of the first vallet exequality that these functions. Attainy line, other self-test comments will explicitly cause the TPM to do a full self-test.

HPM Selfresiful generative TPM rottoerful selfest.

TRM. Certipselfres exists the TRM to do a full select and agniticates it cannot be relied to verify that the select and the se

TPM ContinueSelfilest causes the TPM to test the TPM internal functions that were not tested at startup TPM ContinueSelfilest is unusual, in that it returns a result code to the caller before execution of the command and does not return a result code to the caller before execution of the command and does not return a result code to the caller execution of the command. If the functions used by a capability have not been tested TPM ContinueSelfilest is executed automatically after that capability is called and before it is executed. It is anticipated that the caller on TPM driver software is prepagammed with knowledge of the time that the TPM will require to complete TPM. ContinueSelficst it is anticipated that are call to a TPM. That is executing TPM ContinueSelfics two dates up in a fourty indication.

The reast henselves only ration a TOPA SUCCESS of TGPA FAL answer TPM Gettestresul must be used to discover why self-test falled. Upon the fall derote self-test the TPM does in locally remote and coes not allow most other coestions to continue

End of informative comment.

At startup, a TPM MUST self-test all internal functions that are necessary to do TPM_SHA1Start, TPM_SHA1Update, TPM_SHA1Complete, TPM_SHA1CompleteExtend, TPM_Extend, TPM_Startup, TPM_ContinueSelfTest. This process MUST take 20ms or less.

TSC commands do not operate on shielded locations and have no requirement to be self tested before any use. TPM's SHOULD test these functions before operation.

Some internal functions MUST be tested before the TPM responds to any capability (see 10.8.1). Some internal functions SHOULD be tested before the TPM responds to any capability (see 10.8.2).

If self test has failed, the TPM SHALL respond to all commands (except the update commands) with the error code TCPA_FAILEDSELFTEST (see 10.8.3).

If the functions used by a capability have not been tested, TPM_ContinueSelfTest is executed automatically after that capability is called and before it is executed returning the error TCPA_NEED_SELFTEST

1	2			TCPA_TAG	tag	TPM_TAG_RSP_COMMAND
2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.

Actions

TPM_ContinueSelfTest SHALL cause the TPM to do all self-tests that are outstanding, since startup. It SHALL immediately respond to the caller with a return code. When TPM_ContinueSelfTest finishes execution, it SHALL NOT respond to the caller with a return code.

The TPM SHALL unilaterally execute the functions of TPM_ContinueSelfTest upon receipt of a command that calls a capability-X that uses untested TPM functions. If the self-test fails, the TPM SHALL return the error code TCPA_FAILEDSELFTEST. If the self-test passes, the TPM SHALL execute capability-X.

8.9.4 TPM_GetTestResult

Stant of Informative comments

TAV GetresiResultarovides mentiedurerspedir information regarding the results of the selfest Tips sammand vill, work viren the TRV teamselftest rellucationes. End of informative comment

The TPM MUST support the reset operation. The reset operation clears all handles, authorization sessions and volatile state machines. The reset MUST NOT affect the SRK, PCR and flags such as the flag set by TPM_DisableForceClear.

The TPM MUST support the clear operations. The clear operation MUST perform the following actions:

- Perform a reset operation
- Delete the SRK
- Reset all non-volatile values to factory default except the endorsement key pair
- Return TCPA_NOSRK until there is a proper execution of the ownership function

The TPM MUST support disabling the clear operations. After execution of the TPM_DisableOwnerClear the TPM MUST require physical access to execute the TPM_ForceClear. The TPM MUST support the TPM_DisableForceClear to disable the TPM_ForceClear command. The TPM_DisableForceClear command MUST execute on each startup cycle to be effective.

8.10.1 TPM_Reset

Sano Informative comment

TPM rest valense all resource esported with existing authorsallop sessions. This is useful if a TS Gavertas lockings of Nacauthorsallop state in the TPM for example

End of informative comments

Definition

TPM_Init();

Type

TCPA protected capability that requires physical indication from the platform

Parameters

None

Description

The platform MUST be designed such that if the TPM_Init signal is asserted the entire Platform MUST be initialized. This prevents, at least with a minimum effort, someone touching the TPM_Init pin on the TPM and resetting only the TPM.

The TPM_Init signal MUST have signaling qualifications appropriate for the required conformance and Protection Profile for the Platform.

- 1. The TPM performs a TPM_Reset.
- 2. The TPM sets TCPA_VOLATILE_FLAGS -> postInitialise to TRUE. See 4.13.3 for details of the "postInitialise" state.

8.10.3 TPM_SaveState

3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.

Description

Preserved values MUST be non-volatile.

If data is never stored in a volatile medium, that data MAY be used as preserved data. In such cases, no explicit action may be required to preserve that data.

If an explicit action is required to preserve data, it MUST be possible to determine whether preserved data is valid.

If the parameter mirrored by a preserved value is altered, the preserved value MUST be declared invalid. If the parameter mirrored by any preserved value is altered, all preserved values MAY be declared invalid.

- 1. The contents of all PCRs MUST be preserved.
- 2. The contents of the auditDigest MUST be preserved.
- 3. The state of the flags:
 - i. TCPA_VOLATILE_FLAGS -> PhysicalPresence
 - ii. TCPA_VOLATILE_FLAGS -> PhysicalPresenceLock

- iii. TCPA_VOLATILE_FLAGS -> deactivated
- iv. TCPA_VOLATILE_FLAGS -> disableForceClear

MUST be preservéd.

4. The contents of any key that is currently loaded SHOULD be preserved if the key's parentPCRStatus indicator is FALSE and its IsVolatile indicator is FALSE. The contents of any key that is currently loaded MAY be preserved if its parentPCRStatus indicator is TRUE or its IsVolatile indicator is TRUE.

2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.

Description

TPM_Startup MUST be generated by a trusted entity (the RTM or the TPM, for example).

- If no EK is present, the TPM MUST return TCPA_NO_ENDORSEMENT and exit this capability.
- 2. If TCPA_VOLATILE_FLAGS -> postInitialise is FALSE, the TPM MUST return TCPA_INVALID_POSTINIT, and exit this capability.
- 3. If stType = TCPA_ST_CLEAR
 - a. Reset PCR's

- b. Reset the auditDigest
- c. The TPM Must set the following flags to their default state:
 - i. TCPA_VOLATILE_FLAGS -> PhysicalPresence
 - ii. TCPA_VOLATILE_FLAGS -> PhysicalPresenceLock
 - iii. TCPA_VOLATILE_FLAGS -> disableForceClear
- d. The TPM SHALL set TCPA_VOLATILE_FLAGS -> deactivated to the same state as TCPA_PERSISTENT_FLAGS -> deactivated
- e. The TPM SHALL take all necessary actions to ensure that all loaded keys contain the preserved value if the preserved value is valid and the preserved value's parentPCRStatus indicator is FALSE and its IsVolatile indicator is FALSE. All other key areas MUST be unloaded. If the TPM is unable to successfully complete these actions, it SHALL enter the TPM failure mode.

4. If stType = TCPA_ST_STATE

- a. The TPM SHALL take all necessary actions to ensure that all PCRs contain valid preserved values. If the TPM is unable to successfully complete these actions, it SHALL enter the TPM failure mode.
- b. The TPM SHALL take all necessary actions to ensure that the auditDigest contains a valid preserved value. If the TPM is unable to successfully complete these actions, it SHALL enter the TPM failure mode.
- c. The TPM MUST restore the following flags to their preserved states:
 - i. TCPA_VOLATILE_FLAGS -> PhysicalPresence
 - ii. TCPA_VOLATILE_FLAGS -> PhysicalPresenceLock
 - iii. TCPA_VOLATILE_FLAGS -> deactivated
 - iv. TCPA_VOLATILE_FLAGS -> disableForceClear
- d. The TPM MUST restore all keys that have been saved
- The TPM resumes normal operation. If the TPM is unable to resume normal operation, it SHALL enter the TPM failure mode.

5. If stType = TCPA_ST_DEACTIVATED

- a. The TPM MUST set TCPA_VOLATILE_FLAGS -> deactivated to TRUE
- The TPM MUST invalidate any explicitly preserved state and set TCPA_VOLATILE_FLAGS -> postInitialise to FALSE.

8.10.5 TPM_OwnerClear

Stantoffmormative comments

The Owner Clear command performs the clear operation under Owner authorization, This command a available until the Owner exegutes (iner bisable Owner clear, and which time any further invocation of the command religions Terrandum and the command religions to the command

End of informative comment

Type

TCPA protected capability; user must provide authorization as the TPM Owner.

5	1	4 н1	1	BOOL	continueAuthSession	Fixed value FALSE
6	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: old ownerAuth.

- 1. The TPM verifies that the authHandle properly authorizes the owner.
- 2. After owner verification the TPM then checks the status of the TCPA_PERSISTENT_FLAGS -> DisableOwnerClear flag, if set the TPM returns TCPA_CLEAR_DISABLED.

- 3. The TPM executes the TPM_Reset command. The TPM then destroys the SRK and any internal data associated with the SRK. The TPM then destroys the TPM Ownership data.
- 4. The TPM unloads all loaded keys.
- 5. The TPM sets all DIR registers to their default value.
- 6. The TPM sets TCPA_PERSISTENT_FLAGS to their default values.
- 7. The result will be no Owner or SRK and the TPM is set to the state where it returns TCPA_NOSRK.

8.10.6 TPM_DisableOwnerClear

4	4			UINT32	respSize	The length of the returned capability response
5	0			BYTE[]	resp	The capability response

Actions

The TPM validates the capArea and subCap indicators. If the information is available, the TPM creates the response field and fills in the actual information.

CapArea	subCap	Response
TCPA_CAP_ORD	ORDINAL: A value of command ordinal: see 4.32	Boolean value. TRUE indicates that the TPM supports the ordinal. FALSE indicates that the TPM does not support the ordinal.
TCPA_CAP_ALG	TCPA_ALG_XX: A value of TCPA_ALGORITHM_ID: see 4.15	Boolean value. TRUE indicates that the TPM supports the algorithm, FALSE indicates that the TPM does not support the algorithm.
TCPA_CAP_PID	TCPA_PID: A value of TCPA_PROTOCOL_ID: See 4.15	Boolean value. TRUE indicates that the TPM supports the protocol, FALSE indicates that the TPM does not support the protocol.
TCPA_CAP_PROPERTY	TPM_CAP_PROP_PCR	UINT32 value. Returns the number

	·	of PCR registers supported by the TPM
TCPA_CAP_PROPERTY	TPM_CAP_PROP_DIR	UINT32 value. Returns the number of DIR registers supported by the TPM.
TCPA_CAP_PROPERTY	TCPA_CAP_PROP_MANUFACTURE R	UINT32 value. Returns the Identifier of the TPM manufacturer.
TCPA_CAP_PROPERTY	TCPA_CAP_PROP_SLOTS	UINT32 value. Returns the maximum number of 2048 bit RSA keys that the TPM is capable of loading. This MAY vary with time and circumstances.
TCPA_CAP_VERSION	Ignored	Returns the TCPA_VERSION structure that identifies the version of the TPM. See 4.5
TCPA_CAP_KEY_HANDLE	Ignored	A TCPA_KEY_HANDLE_LIST structure, describing the handles of all keys that are currently loaded into the TPM. See 4.9
TCPA_CAP_CHECK_LOAD ED	ALGORITHM: A value of TCPA_KEY_PARMS: see 4.15	A Boolean value. TRUE indicates that the TPM has enough memory available to load a key of the type specified by ALGORITHM. FALSE indicates that the TPM does not have enough memory.

The permitted values of TCPA_CAP_PROP_MANUFACTURER and their meaning SHALL be defined in platform specific TCPA specifications.

IDL Definitions of subCap

5	4	4s	4	UINT32	respSize	The length of the returned capability response
6	. 🗘	5s	٥	BYTE[]	resp	The capability response
7	4	6s	4	UINT32	sigSize	The length of the returned digital signature
8	¢	7s	¢	BYTE[]	sig	The resulting digital signature.
9	20	2н1	20	TCPA_NONCE	nonceEven	Even nonce newly generated by TPM to cover outputs
		3н1	20	TCPA_NONCE	nonceOdd	Nonce generated by system associated with authHandle
10	1	4 н1	1	BOOL	continueAuthSession	Continue use flag, TRUE if handle is still active
11	20			TCPA_AUTHDATA	resAuth	The authorization digest for the returned parameters. HMAC key: key.usageAuth

Description

The key in keyHandle MUST have a KEYUSAGE value of type TPM_KEY_SIGNING or TPM_KEY_LEGACY or TPM_KEY_IDENTITY.

- 1. The TPM calls TPM_GetCapability passing the capArea and subCap fields and saving the resp field as r1.
- 2. The TPM creates h1 by taking a SHA1 hash of the concatenation (r1 || antiReplay).
- 3. The TPM validates the authority to use keyHandle
- 4. The TPM creates a digital signature of h1 using the key in keyHandle and returns the result in sig.

ì		1	l .		

Description

For 31>=N>=0

- Bit-N of the TCPA_PERSISTENT_FLAGS structure is the Nth bit after the opening bracket in the
 definition of TCPA_PERSISTENT_FLAGS in the version of the specification indicated by the
 parameter "version". The bit immediately after the opening bracket is the 0th bit.
- Bit-N of the TCPA_VOLATILE_FLAGS structure is the Nth bit after the opening bracket in the
 definition of TCPA_VOLATILE_FLAGS in the version of the specification indicated by the
 parameter "version". The bit immediately after the opening bracket is the 0th bit.
- Bit-N of non_volatile_flags corresponds to the Nth bit in TCPA_PERSISTENT_FLAGS.
- Bit-N of volatile_flags corresponds to the Nth bit in TCPA_VOLATILE_FLAGS.

- 1. The TPM validates that the TPM Owner authorizes the command.
- 2. The TPM creates the parameter non_volatile_flags by setting each bit to the same state as the corresponding bit in TCPA_PERSISTENT_FLAGS. Bits in non_volatile_flags for which there is no corresponding bit in TCPA_PERSISTENT_FLAGS are set to zero.
- The TPM creates the parameter volatile_flags by setting each bit to the same state as the
 corresponding bit in TCPA_VOLATILE_FLAGS. Bits in volatile_flags for which there is no
 corresponding bit in TCPA_VOLATILE_FLAGS are set to zero.
- 4. The TPM generates the parameter "version".
- 5. The TPM returns non_volatile_flags, volatile_flags and version to the caller.

8.12 Audit Commands

Sten communitye continent

The ITPM and ISS trees to be able to Geronia log o revens. The log uses the same careuigh as the IPGRs the IRRN trees at PGR value that extends for each dog event and the ISS maintains the log entrestion. Balletine is to review

ikie Owner hes the ability to set which functions generate an audit even and to charge which function general Newvert a kiny time

The selus of the audit generation is not seen as sensitive mornalion and so the command to determine The selus of the generation is not an authorized command.

Endio informative comment

Each command ordinal has an indicator in non-volatile TPM memory indicating if executing the command will result in the generation of an audit event.

The audit event includes the command ordinal and the return code from the command.

The digest value SHALL be SHA1 (previous value || command ordinal || return code). The digest value register SHALL have a starting value of NULLS.

Updating of auditDigest MAY cease when TCPA_VOLATILE_FLAGS -> deactivated is TRUE. This is because a deactivated TPM performs no useful service until a platform is rebooted, at which point auditDigest is reset.

Actions

The TPM returns the Boolean value for the given ordinal. The value is TRUE if the command is being audited.

8.12.5 Effect of audit failing after successful completion of a command

Starkof informative comment

Min operation මෙන්ම පොතුන්වන පැහිමෙන්න්ම දැන්න then when its TIPM elignos to end, the command the evoligiogess could have shall tennal endocthal downes, its ITPM to return endoctor.

This section indexes what the TRM must do to this case in addition to setting the state that requires the TRM to rain in TRM TRAITEDS ELEMEST

End of unformative comment

When after successful completion of an operation, and in performing the audit process, the TPM has an internal failure (unable to write, SHA failure etc.) the TPM MUST set the internal TPM state such that the TPM returns the TPM_FAILEDSELFTEST error. The TPM MUST return TCPA_AUDITFAILURE for the current command.

If the TPM is permanently nonrecoverable after an audit failure, then the TPM MUST always return TPM_FAILEDSELFTEST for every command other than TPM_GetTestResult. This state must persist regardless of power cycling, the execution of TPM_Init or any other actions.

If the TPM can recover in any way after the failure of an audit operation, then the TPM MUST take the actions stated in the following table after setting the failure state.

Ordinal	Effect when Audit Fails
TPM_ORD_OIAP	No action - session deleted on TPM INIT
TPM ORD OSAP	No action - session deleted on TPM INIT
TPM_ORD_ChangeAuth	No action - changed blob not returned so
	nothing to delete
TPM_ORD_TakeOwnership	TPM returns to state where there is no
	TPM Owner.
TPM_ORD_ChangeAuthAsymStart	No action - session deleted on TPM INIT
TPM_ORD_ChangeAuthAsymFinish	No action - session deleted on TPM INIT
TPM_ORD_ChangeAuthOwner	The TPM MUST revert back to the previous

2	4			UINT32	paramSize	Total number of output bytes including paramSize and tag
3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.

Action

The TPM SHALL set the TCPA_PERSISTENT_FLAGS.disable value to FALSE.

In order to execute this command, the TPM MUST obtain unambiguous assurance that operation of this command is authorized by physical presence at the platform. The command MAY be initiated by the presentation to a TPM of a message block with the above input parameters, provided that the message block occurs while the TPM is presented with unambiguous assurance that operation of this command is authorized by physical presence at the platform.

Unambiguous assurance that operation of this command is authorized by a physical action at the platform MAY be communicated to a TPM using a special bus cycle that is impossible for software to create, or asserting a single electrical signal that is impossible for software to create, for example.

It SHALL be impossible to subvert this command to a TPM by the execution of instructions in a computing engine on the platform.

landroi vintormatlixe gomment

IDL Definition

```
TCPA_RESULT TPM_FieldUpgrade(
   [in, out] TCPA_AUTH* ownerAuth,
   ...):
```

Type

TCPA protected capability; the TPM Owner must authenticate the command. This is an optional command and a TPM is not required to implement this command in any form.

Parameters

Type	Name	Description
TCPA_AUTH	ownerAuth	Authentication from TPM owner to execute command
•••		Remaining parameters are manufacturer specific

Actions

The TPM SHALL perform the following when executing the command:

- 1. Validate the TPM Owners authorization to execute the command
- 2. Validate that the upgrade information was sent by the TPME. The validation mechanism MUST use a strength of function that is at least the same strength of function as a digital signature performed using a 2048 bit RSA key.
- 3. Validate that the upgrade target is the appropriate TPM model and version.
- 4. Process the upgrade information and update the protected capabilities
- 5. Set the TCPA_PERSISTENT_DATA.revMajor and TCPA_PERSISTENT_DATA.revMinor to the values indicated in the upgrade. The selection of the value is a manufacturer option. The values MUST be monotonically increasing. Installing an upgrade with a major and minor revision that is less than currently installed in the TPM is a valid operation.
- 6. Set the TCPA_VOLATILE_FLAGS.deactivated to TRUE.

Descriptions

The upgrade mechanisms in the TPM MUST not require the TPM to hold a global secret. The definition of global secret is a secret value shared by more than one TPM.

The TPME is not allowed to pre-store or use unique identifiers in the TPM for the purpose of field upgrade. The TPM MUST NOT use the endorsement key for identification or encryption in the upgrade process. The upgrade process MAY use a TPM Identity to deliver upgrade information to specific TPM's.

The upgrade process can only change protected capabilities.

The upgrade process can only access data in shielded locations where this data is necessary to validate the TPM Owner, validate the TPME and manipulate the blob

The TPM MUST be conformant to the TCPA specification, protection profiles and security targets after the upgrade. The upgrade MAY NOT decrease the security values from the original security target.

The security target used to evaluate this TPM MUST include this command in the TOE.

THE PROPERTY OF THE CONTROL OF THE PARTY OF THE PROPERTY OF THE PARTY OF THE CONTROL OF THE PARTY OF THE PART

End of informative comment

The PRIVEK and PUBEK MUST be accessed only by protected capabilities whose definition explicitly requires access to those keys.

The PRIVEK and PUBEK MAY be created by a process other than the use of TPM_CreateEndorsementKeyPair. If so, the process MUST result in a TPM and endorsement key whose properties are the same as those of a genuine TPM and an endorsement key created by execution of TPM_CreateEndorsementKeyPair in that TPM.

- The process MUST result in the same TPM state as that created by execution of TPM_CreateEndorsementKeyPair.
- The process MUST guarantee correct generation, cryptographic strength, uniqueness, privacy, and installation into a genuine TPM, of the endorsement key.
- The TPME, when creating the Endorsement Certificate, MUST be satisfied that the described endorsement key does exist in a genuine TPM and was installed by a process that met or exceeded the assurances provided by a genuine TPM performing TPM_CreateEndorsementKeyPair.
- The process MUST be defined in the TOE of the security target in use to evaluate the TPM

3	4			TCPA_RESULT	returnCode	The return code of the operation. See section 4.3.
4	<>			TCPA_PUBKEY	pubEndorsementKey	The public endorsement key
5	20			TCPA_DIGEST	checksum	Hash of pubEndorsementKey and antiReplay

Description

Туре	Name	Description
TCPA_STORE_A SYMKEY	PRIVEK	This SHALL be the private key of the endorsement key pair.
TCPA_PUBKEY	PUBEK	This SHALL be the public key of the endorsement key pair.

The PRIVEK SHALL exist only in a TCPA-shielded location.

If the data structure TPM_ENDORSEMENT_CREDENTIAL is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is available to authorized entities.

Actions

The first valid TPM_CreateEndorsementKeyPair command received by a TPM SHALL

- 1. Validate the keyInfo parameters for the key description
 - a. If the algorithm type is RSA the key length MUST be a minimum of 2048. For interoperability the key length SHOULD be 2048

- b. If the algorithm type is other than RSA the strength provided by the key MUST be comparable to RSA 2048
- c. The other parameters of keyInfo (signatureScheme etc.) are ignored.
- 2. Create a key pair called the "endorsement key pair" using a TCPA-protected capability. The type and size of key are that indicated by keyInfo
- 3. Create checksum by performing SHA1 on the concatenation of (PUBEK || antiReplay)
- 4. Store the PRIVEK.
- 5. Export the data structures PUBEK and checksum
- 6. Set TCPA_PERSISTENT_FLAGS -> CEKPUsed to TRUE

Subsequent calls to TPM_CreateEndorsementKeyPair SHALL return code TCPA_FAIL.

The PKI (dentity protocol enables a Trusteo Platform Module to Pave (multiple Centities decondentity may have altestallong com exactly one Privacy KeAs

Obtaining a TPM identity

The TPM creates—an identity-binding signature (the value of a signature over the TGPA IDENTITY CONTENTS structure) Among other things, this proves possession of the new private key which does the signing of the TGPA IDENTITY CONTENTS structure. The subsystem sends the signature along with evidence of a genuine TPM and the platform the TRM resides on to a Privacy GA. The encryption of the requestis to provide privacy not security.

The Privacy Anthrocus the evidence and concurs that the TTP (the genuine and the valle patrom). The Privacy OA vallence the appropriate the ap dentity attestation

The Privacy Oxident of Greek that the public key inside techtly birding signature delongs to a genuine TPM, out it knows that the TPM described in the evidence is a genuine TPM. The Privacy GA demandes the altestation evedential and entry is the evedential for decryption to the requesting TPM. The Privacy GA also sentistic dentities a statement that the evedential attests to a cartetial public key tindential actions for a cartetial public key tindential actions for a cartetial public key tindential actions for a cartetial public key tindential action of antity-evedential).

The TPM receives the encrypted cata. It cannot passe the electental found can check that the organital attests to one of its abolic keys, by oreeking the statement, from the Privacy CA. Only if the credental relates to one of its abolic keys, by oreeking the TPM enable receivery of the orecentral relates to one of the TPM is publicately attest and the must be the case for the ascertance of the attest and the presumption is that the Privacy CA is the worthy into must be the case for the ascertance of the attest attended by an third conty. Hence, if the attest attended in a ving the statement from the Privacy CA to the TPM can be trusted. Hence, the TPM knows that the encrypted oredential relates to the publicate that conty a genuine TPM can receive the encrypted oredential and statement, and that at genuine TPM will repaile recovery of the credential conty in
Allogue can certainly pose as a Privacy CA and cause the TPM to release the credential created by that togue! But who will trust the attestation provided by that rogue? A trustworthy credential can be recovered only it attests to a public key of a genuine TRM, because the Privacy. CA that created the credential can

be trusted to one of that a TRIVIStoen vine and to correctly state that a credential describes a spanticular public key, and sagenuine TRIV checks that the public key belongs to that TRIVI before releasing the credential

The reason for including the ries portion public keylor the Privacy CA inside identify admining signature is to prevent a request obtaining site station from multiple Privacy CAS. The identify administration is an atomic operation performed at the same time as the key real greation, and therefore the TPM cannot be received into creating a version of the identify admining signature with the same keys but a clifferent Privacy CA soublickey.

Tahe Identity-binding signature is rone of the few operations that ere permitted to use the private (signature) key of a TPAM centity /A version of dentity binding with a differentity reay @A public textoan be reproduced by commends from outside the TPAM tecause the TPAM will refuse to sign arbitrary data with a private (signature) key of a TPAM tecatily

The process deliberately has certain characteristics

For example, during ARM ayake dentity

- ि पति atomo ganeritor of the they pair सत्त्व energies toerdly joigiling thiomation prevents the gration style प्रमुख्य स्थापन विध्यापिक foentity binding information will avoiding the meeting of प्रमुख्य स्थानुसार
- ে Signing -Wilh the private (signature) key.-০। a মাRM identity prevents the creation of dublicate ুidentity_binding/information outside a TPM:
- When a Privacy CA receives data; it can use the data describing the new TPM identity to check that the request for attestation (its came from a genuine TPM) is a unique request, use the endorsement credentials to check that a stated TPM is a genuine TPM, and use the platform credentials and conformance credentials to check that a stated platform is a genuine Trusted Platform. The Privacy CA cannot however verify that the new TPM identity was actually generated by that dentine TPM. On the assumption, however, that the new TPM identity was actually generated by argentine TPM, the Privacy CA generates TPM IDENTITY CREDENTIALs and a statement that expresses a binding pervise it has TPM. (DENTITY CREDENTIAL and the new TPM) identity The Privacy CA then ensyres his information so that it can be recovered only by the genuine TPM described by the encorement credentials.
- o During TRYLAGIVETERONILL the genuing TRY checks that the energical TRY (paying that the energical TRY) (paying the tryle to the tryle tryle to the tryle to the tryle tryle to the tryle to the tryle tryle to the tryle tryle to the tryle tryle tryle to the tryle tryle tryle to the tryle try
- o This entre process depends drittedly, an une trasiworthmess of the Privacy ©A. If the Privacy ©A de trusivorthy and most offer the Privacy ©A describes an identity of a gentine TPM Otherwise a TPM IDENTITY OR EDENTIAL earnor be trusted this Privacy OA must recursive the invited this Privacy OA must recursive the tribacy of a gentine the stated town and platform are gentine. The Privacy OA must be trusted never to recuss and the stated TPM and platform are gentine. The Privacy OA must be trusted never to rever to rever a country to copy of TPM IDENTITY OR EDENTITY. And to be firstlift when a country the particular terms of the particular terms.

Description

The command TPM_MakeIdentity is used to generate an identity in a TPM and to request attestation to that identity.

The public key of the new TPM identity SHALL be identityPubKey. The private key of the new TPM identity SHALL be tpm_signature_key.

This command requires XOR encryption of the authorization to use the new identity. To create an XOR string, the caller takes the OSAP session shared secret, concatenates it with authLastNonceEven, and then hashes the result. This hash encrypts the authorization value and produces identityAuth.

Properties of the new identity

Type	Name	Description
TCPA_PUBKEY	identityPubKey	This SHALL be the public key of a previously unused asymmetric key pair.
TCPA_STORE_ASY MKEY	tpm_signature_key	This SHALL be the private key that forms a pair with identityPubKey and SHALL be extant only in a TCPA-shielded location.

This capability also generates a TCPA_KEY containing the tpm_signature_key.

If identityPubKey is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is available to authorized entities.

Actions

A Trusted Platform Module that receives a valid TPM_MakeIdentity command SHALL do the following:

- 1. Validate the idKeyParams parameters for the key description
 - a. If the algorithm type is RSA the key length MUST be a minimum of 2048. For interoperability the key length SHOULD be 2048
 - b. If the algorithm type is other than RSA the strength provided by the key MUST be comparable to RSA 2048

- 2. Use authHandle to verify that the Owner authorized all TPM_MakeIdentity input parameters.
- 3. Use srkAuthHandle to verify that the SRK owner authorized all TPM_MakeIdentity input parameters.
- Verify that idKeyParams -> keyUsage is TPM_KEY_IDENTITY. If it is not, return TCPA_BAD_PARAMETER"
- Verify that idKeyParams -> keyFlags -> migratable is FALSE. If it is not, return TCPA_BAD_PARAMETER"
- Obtain the identity_authorization to be associated with the new TPM identity, by decrypting the field IdentityAuth. The establishment of the TPM_OSAP session MUST use the authentication of the TPM Owner.
- 7. Set continueAuthSession to FALSE.
- 8. Create an asymmetric key pair (identityPubKey and tpm_signature_key) using a TCPA-protected capability, in accordance with the algorithm specified in idKeyParams
- 9. Create TCPA_KEY structure idKey using idKeyParams as the default values for the structure.
- 10. Ensure that the authorization information in identityAuth is properly stored in the idKey as usageAuth.
- 11. Attach identityPubKey and tpm_signature_key to idKey
- 12. Set idKey -> migrationAuth to TTCPA_PERSISTANT_DATA -> tpmProof
- 13. Ensure that all TCPA_PAYLOAD_TYPE structures identity this key as TCPA_PT_ASYM
- 14. Encrypt the private portion of idKey using the SRK as the parent key
- 15. Create a TCPA_IDENTITY_CONTENTS structure named idContents using labelPrivCADigest and the information from idKey
- 16. Sign idContents using tpm_signature_key and TCPA_SS_RSASSAPKCS1v15_SHA1. Store the .result in identityBinding.

9.3.2 TSS_CollateIdentityRequest

Start of intormative comment

iThe optipose of the TSS. Collate dentityRequest command is to assemble all the data that will be require by at Privacy. CAN norder locassess and alternancial testato the identity of a Subsystem.

The TYSS Collaratemity Request command its saparaterizors the TPM Makelolantity command to exause their processing might be done on different engines. The reason to that TISS Collaterently Request to be possible to be trustiviously four TPM (Makelolantity must be trustiviously Therefore, and Implementation of TISS Collaterativity four TPM (Makelolantity must be trustiviously Therefore, and Implementation of TISS Collateratemity Request closs and measure the same spoteotion as an ambiguence tation of TPM (Makelolantity).

A session key (a nonce) is used to provide confidentially of the Tiopa (DENTITY REQ). This is to distrellificationly the Privacy GA oboset by the Owner can intermed the detational minimizate rexposure of that Privacy CAS Toently (Outlie) key

Once the data structure TCPA (DENTITY) REQUAS been graduced this hould be sent to the Privacy G Grosen by the Ovincia

End of informative comment

Type

TSS capability and MAY be TPM capability.

Suggested Parameters

Туре	Name	Description
TCPA_IDENTITY_PROOF	proof	This SHALL be the structure specified in 4.30.3
TCPA_KEY_PARMS	SymAlgorithm	This SHALL specify the type of symmetric encryption algorithm to be used for a session key, and the scheme it will use to perform encryptions.
TCPA_PUBKEY	CaPubKey	This SHALL be public key of the CA which will provide the credential for the identity
UINT32*	ReqSize	This SHALL be the size of the identityReq field
TCPA_IDENTITY_REO*	IdentityRequest	This SHALL be the data structure defined in this section.

Description

The command TSS_CollateIdentityRequest assembles all data necessary to request attestation of a Trusted Platform Module identity.

The structure "proof" (of type TPM_IDENTITY_PROOF) contains fields that a privacy-CA requires in order to decide whether to attest to the TPM identity described by "proof".

A Trusted Platform Subsystem that receives a valid TSS_CollateIdentityRequest command SHALL export the data structure "TCPA_IDENTITY_REQ."

The TSS in executing this function performs two encryptions. The first is to symmetrically encrypt the information and the second is to encrypt the symmetric encryption key with an asymmetric algorithm. The symmetric key is a random nonce and the asymmetric key is the public key of the CA that will provide the identity credential.

For reasons of interoperability, CaPubKey SHOULD indicate TCPA_ALG_RSA (RSA) with a key length of 2048 bits. SymAlgorithm SHOULD be TCPA_ALG_3DES (3DES in CBC mode).

The use of TCPA_ALG_AES (AES in CBC mode) as the symmetric algorithm is encouraged.

Actions

The command SHALL perform the following actions:

- Validate that the TSS can support the symmetric algorithm and the asymmetric algorithm necessary to perform the encryptions. If the TSS does not support these algorithms it MUST return TCPA_BAD_PARAMETER.
- 2. Initialize the identityRequest area to be the TCPA_IDENTITY_REQ structure.
- 3. Create a session key in accordance with the algorithm in SymAlgorithm, by calling TSS, GetRandom,
- 4. Create an IV in accordance with the algorithm in SymAlgorithm, by calling TSS_GetRandom.
- 5. Encrypt the TCPA_IDENTITY_PROOF structure using the session key created in step 3, the IV created in step 4, and the symmetric algorithm specified by SymAlgorithm.
- 6. Place the encrypted TCPA_IDENTITY_PROOF blob into the TCPA_IDENTITY_REQ.symBlob field.
- 7. Create a TCPA_SYMMETRIC_KEY structure using the session key created in step 3.
- 8. Encrypt the TCPA_SYMMETRIC_KEY structure created in step 7 using the algorithm specified in the key caPubKey.
- 9. Place the encrypted TCPA_SYMMETRIC_KEY blob into the TCPA_IDENTITY_REQ.asymBlob field.
- 10. Create TCPA_IDENTITY_REQ.SymAlgorithm using SymAlgorithm and inserting the IV created in step 4 into the previously empty "parms" field.
- 11. Create TCPA_IDENTITY_REQ.AsymAlgorithm from CaPubKey.
- 12. Return the TCPA_IDENTITY_REQ structure.

Description

The command TPM_ActivateIdentity activates a TPM identity created using the command TPM_MakeIdentity.

The command assumes the availability of the private key associated with the identity. The command will verify the association between the keys during the process.

The command will decrypt the TCPA_ASYM_CA_CONTENTS structure, extract the session key and verify the connection between the public and private keys.

Actions

A Trusted Platform Module that receives a valid TPM_ActivateIdentity command SHALL do the following:

- Using the authHandle field, validate the owner's authorization to execute the command and all of the incoming parameters.
- 2. Using the idKeyAuthHandle, validate the authorization to execute command and all of the incoming parameters
- Decrypt blob using PRIVEK as the decryption key. The resulting decrypted area MUST be a TCPA_ASYM_CA_CONTENTS structure.
- Compute a digest of the public key in the idKey. Compare the computed digest to the value in the decrypted TCPA_ASYM_CA_CONTENTS structure. Return with the error code TCPA_BAD_PARAMETER on a mismatch.
- Validate that the idKey is the public key of a valid TPM identity by checking that idKey -> keyUsage is TPM_KEY_IDENTITY
- 6. Return the session key from the TCPA_ASYM_CA_CONTENTS structure.

The pulsose of TSS Recoverationity is no resover a plantex copy of the data structure TRM_DENTITY_CREDENT(AL balatics is that avaid our centity belongs to a genuine TCPA trastec Ration

The TSS_Recovercentry command is separate from the TPM. Activate centric command because the processing might become on all reminencines. The reason its that TSS_Recovercently does not have at be instruction, the instruction of the senior o

Seally one onlighter receipt to a 177 Miller of the

Access to the TRAIDENTITY GREDENTIAL mas be restricted to entities that have a "need to know This is for teasons of privacy.

The command TSS_RecoverIdentity obtains a plaintext copy of the TPM_IDENTITY_CREDENTIAL created by a Privacy CA.

If the data structure TPM_IDENTITY_CREDENTIAL is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is only available to authorized entities.

Suggested Parameters

Type	Name	Description
TCPA_SYMMETRIC_KEY	SessionKey	This SHALL be the symmetric key decrypted by the TPM_ActivateIdentity
UINT32	symAttSize	This SHALL be the size of the symAtt parameter
TCPA_SYM_CA_ATTEST ATION*	symAtt	This SHALL be the TCPA_SYM_CA_ATTESTATION structure
UINT32*	CredentialSize	This SHALL be the size of the credential
BYTE*	Credential	This SHALL be the decrypted TCPA_IDENTITY_CREDENTIAL

Actions

A Trusted Platform Subsystem that receives a valid TSS_RecoverIdentity command SHALL do the following:

- 1. Using the session key and the symmetric algorithm indicated by algorithm and the algorithm parameters, decrypt credential parameter inside TCPA_SYM_CA_ATTESTATION to recover the TPM_IDENTITY_CREDENTIAL.
- The TSS SHOULD verify the self-consistency of TPM_IDENTITY_CREDENTIAL and abandon this TSS_RecoverIdentity process if there is an inconsistency. The process of verifying certificates is outside the scope of this specification.
- 3. Export TPM_IDENTITY_CREDENTIAL.

9.4 Instantiation of Data When Contacting a Privacy CA

9.4.1 From Owner to Privacy CA

The protocol from the Owner to the Privacy CA SHALL consist of the following IdentityRequest message:

asymAlg TcpaAlgorithmParms, symAlg TcpaAlgorithmParms,

```
asymBlob
                          EncTcpaSymmetricKey,
       symBlob
                          EncTcpaldentityProof
Version ::= INTEGER
-- the version number, for compatibility with future revisions of
-- this specification. It shall be 0 for this version of the
-- specification.
TcpaAlgorithmParms ::= SEQUENCE {
       algId
                          AlgorithmIdentifier,
                          OCTET STRING
      parms
       -- the parameters for the algorithm specified in algId
EncTcpaSymmetricKey ::= BIT STRING
-- the ciphertext resulting from the encryption (under the public
-- identity key of the Privacy CA) of the following DER-encoded data
-- structure.
TcpaSymmetricKey ::= SEQUENCE {
                       AlgorithmIdentifier,
OCTET STRING, -- TCPA_ENCRYPTION_SCHEME
       algId
       encScheme
                          BIT STRING -- randomly-generated session key
      data
)
EncTcpaldentityProof ::= BIT STRING
-- the ciphertext resulting from the encryption (under the session
-- key in TcpaSymmetricKey above) of the following DER-encoded data
-- structure:
TcpaIdentityProof ::= SEQUENCE {
      tcpaVersion TCPASpecVersion, -- "major.minor" tpmIdKey SubjectPublicKeyInfo, -- new public key
                     OCTET STRING, -- identity label no BIT STRING, -- (see below)
      tpmIdLabel
      identityBinding BIT STRING,
      endorsementCred Certificate, -- X.509v3 PK cert platformCred Certificate, -- X.509 attr. cert conformanceCred Certificate -- X.509 attr. cert
}
-- SubjectPublicKeyInfo
-- (a SEQUENCE of an AlgorithmIdentifier and a BIT STRING) is
-- specified in X.509. The BIT STRING contains the subject's public
-- key (for example, if the algorithm specified is rsaEncryption, the
-- BIT STRING contains the BER encoding of a value of PKCS #1 type
-- "RSAPublicKey").
-- identityBinding
-- is the signature value (using the newly generated TPM private key
-- that corresponds to the public key in tpmIdKey) over the data
-- specified in Section 4.30.1 TCPA IDENTITY CONTENTS. How that data -- is
formatted or delimited is beyond the scope of the protocol
-- specified here; however, the formatting chosen must be known to
-- both the TPM and the Privacy CA.
```

9.4.2 From Privacy CA to Owner

The protocol from the Privacy CA to the Owner consists of the PCAResponse message: PCAResponse ::= SEQUENCE { Version, version AlgorithmIdentifier, symmAlg encTcpaAsymCaContents EncTcpaAsymCaContents, tcpaSymCaAttestation TcpaSymCaAttestation } EncTcpaAsymCaContents ::= BIT STRING -- the ciphertext resulting from the encryption (under the PUBEK of -- the TPM) of the following DER-encoded data structure: TcpaAsymCaContents ::= SEQUENCE { BIT STRING, -- hash of tpmIdKey idDigest BIT STRING sessionKey } -- NOTE: the validity of the entire protocol for obtaining a TPM -- identity depends critically upon the assumption that a genuine -- TPM will only ever decrypt data using its PRIVEK as part of the -- TPM ActivateIdentity() call. An Owner will never be able to ask a -- TPM for the decryption of arbitrary data that has been encrypted -- with its PUBEK. Furthermore, the difficulty of successfully -- impersonating a TPM is ultimately bound to the computational -- complexity of finding a collision for idDigest. It is therefore -- STRONGLY RECOMMENDED that the digest be computed using the full -- output of a cryptographic hash algorithm of sufficient strength -- (e.g., the full 160 bits of SHA-1). TcpaSymCaAttestation ::= SEQUENCE { encCredential TcpaAlgorithmParms, BIT STRING -- the ciphertext resulting from the encryption (under the -- symmetric session key in TcpaAsymCaContents above) of the -- tpmIdentityCredential (which is itself DER-encoded as an -- X.509 PK Certificate). }

9.5 Instantiation of Credentials as Certificates

Star¢orlinformative.comment

Unambiguous caimition oj a dala sirvature con amino recentials is necessary in those repaintals are d be communicated between plaitoms. A centileate is such an unambiguous definition

Tine TCPA requires crecentials to prove various pieces of prior mation. This version of the specification uses x 500 ben'invales to provide these credentials. The TCPA is not requiring the entire play to the country of the x 500 parties are the control of the x 500 parties. The TCPA is using the well defined services structure to refate the hecessary TCPA decembers.

End of informative comment

Certificate syntax

TCPA certificate syntax conforms with the definitions for public-key certificates and attribute certificates in X.509. The following TCPA certificate types are public-key certificates:

- TPM endorsement certificate
- TPM identity certificate

The following TCPA certificate types are attribute certificates:

- · Platform endorsement certificate
- Platform conformance certificate
- Validation data certificate

The form of the following certificates is out of scope for this version of the TPM specification:

- TPM endorsement entity certificate
- TCPA component endorsement entity certificate
- Platform endorsement entity certificate
- Platform conformance certificate

The serial number used by the following certificates is not unique for each platform. It is anticipated that the serial number would remain the same on multiple platforms.

For instance, all platforms of the same model and version would have the same serial number in their platform endorsement credential. For these same platforms, the platform conformance certificates would all use the same serial number but that number would be different than the endorsement certificate serial number.

land of this matrix comment

If the data structure <endorsement_certificate> is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is available to authorized entities.

Overview

The TPM endorsement certificate represents an assertion by the TPM endorsement entity that the referenced TPM conforms with the TCPA TPM specification.

Profile

Notes:

- Some fields are assigned a value even though the certificate user performs no action based on that value. In such cases, the intention is to inhibit non-TCPA implementations from making inappropriate use of the certificate.
- It is intended that the lifetime of a TPM will be shorter than the crypto-period of the TPM endorsement public and private keys. Therefore, keys are not "rolled-over".
- The trustworthiness of the architecture is vulnerable to the compromise of a single TPM endorsement private key. However, the architecture does not include a revocation mechanism. Nevertheless, certain forms of revocation scheme can be retrofitted, should it become necessary at some time in the future.

In the case of the TPM endorsement certificate, the *issuer* is the TPM endorsement entity and the *user* is a Privacy CA.

Field	Issuer action	User action
Version	Assign value 2 (v3).	Check value = 2, else reject.
Serial number	Assign a value unique amongst all certificates issued by "issuer".	Use in validating the platform endorsement and conformance certificates.
Signature	Assign the algorithm identifier sha- 1WithRSAEncryption (1:2:840:113549:1:1:5).	Check the algorithm identifier = 1:2:840:113549:1:1:5, else reject. Validate the signature on the certificate using the public key of the TPME (which shall be a 2048-bit RSA key), obtained by an out-of-band means and referenced by "issuer" and "authority key identifier".
Issuer	The distinguished name of the TPM endorsement entity. That is the entity that asserts that the subject TPM conforms with the TCPA specification. (Note: this may be the TPM manufacturer or a conformance test laboratory.)	Check that the name is the name of one of the acceptable TPM endorsement entities, use in validating the platform endorsement and conformance certificates.

Malidia	T Assiss setDefere to the	
Validity	Assign notBefore to the current time and notAfter to a later time (maybe the latest time permitted by the encoding scheme).	Check that the current time is later than the notBefore time, else reject.
Subject	Assign the value NULL.	No action.
Subject public key info	Assign algorithm identifier RSAES-OAEP (1:2:840:113549:1:1:7). Include a 2048-bit RSA public key for key encipherment with OAEP formatting. (Note: this is the TPM public endorsement key.)	Use the public key in the TPM identity protocol.
Issuer unique identifier	Omit.	No action.
Subject unique identifier	Omit.	No action.
Extensions		
Authority key identifier	Assign "critical" the value FALSE. Assign the value of "subject key identifier" from the manufacturer's certificate, if available, else omit.	Use to locate the certificate that contains a public key of the manufacturer with which the signature on this certificate can be verified.
Subject key identifier	Omit.	No action.
Key usage	May be omitted. If included, then the key encipherment bit shall be set TRUE.	If present, then check that the key encipherment bit is TRUE, else reject.
Extended key usage	Omit.	If present and marked critical, then reject.
Private key usage period	Omit.	If present, then check that the current time is later than the notBefore time.
Certificate policies	Assign "critical" the value TRUE. Assign policyldentifier at least one object identifier. Assign the cPSuri policy qualifier the value of an HTTP URL at which a plain language version of the TPM endorsement entity's certificate policy may be obtained. Assign the explicit text userNotice policy qualifier the value "TCPA Trusted Platform Module Endorsement".	Check that at least one acceptable policyldentifier value is present. Transfer the acceptable policylnformation value to the TPM identity certificate "certificate policies" extension.
Policy mappings	Omit.	No action.
Subject alternative name	Assign "critical" the value FALSE. Include the TPM identity, using the directory name-form with RDNs for the TPM manufacturer, model and version numbers.	Check that the TPM manufacturer, model and version numbers are acceptable. Transfer to the TPM identify certificate "subject alternative name" extension value for the TPM.
Issuer alternative name	Omit.	No action.

Subject directory attributes	Include a "subject directory attributes" extension. Assign "critical" the value FALSE. Include the multi-valued attribute "supported algorithms" (see X.509). Include object identifiers for the following algorithms: RSAES-OAEP, SHA-1 (1.3.14.3.2.26) and TPM identity protocol.	Adapt the TPM identity protocol to use only algorithms supported by the TPM.
	Include the "TCPA Specification Version" attribute, with field values correctly reflecting the highest version of the TCPA specification with which the TPM implementation conforms.	Check that the TCPA specification version is acceptable, else reject.
	Optionally, include the "security qualities" attribute with a text string reflecting the security qualities of the TPM. (Note: this is the TPM distributed validation.)	Optionally (and if present), check whether the TPM implementation has acceptable security qualities. Transfer to the TPM identity certificate "subject directory attributes" extension.
Basic constraints	Assign "critical" the value TRUE. Assign "CA" the value FALSE	No action.
Name constraints	Omit.	No action.
Policy constraints	Omit.	No action.
Inhibit any policy	Omit.	No action.
CRL distribution points	Omit.	If present and marked critical, then reject.

9.5.2 Instantiation of PLATFORM_CREDENTIAL

Start of Informative comments Afglation centificate is antinstantiallon of a platform, crecardal Access to the platform certificate must be restricted to entities that drave a deed to know this is for reasons of privacy Endso informative comment

If the data structure <platform_certificate> is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is available to authorized entities.

Overview

The Platform Endorsement Certificate represents an assertion by the platform endorsement entity that the referenced platform incorporates a TPM and an RTM in a manner that conforms with the TCPA specification.

Profile

Note: some fields are assigned a value even though the certificate user performs no action with that value. In such cases, the intention is to inhibit non-TCPA implementations from making inappropriate use of the certificate.

In the case of the Platform endorsement certificate, the *issuer* is the platform manufacturer and the *user* is a Privacy CA.

Field	Issuer action	User action
Version	Assign value 1 (v2).	Check value = 1, else reject.
Holder	BaseCertificateID referencing the corresponding TPM endorsement certificate. (Note: this is the TPM credential reference.)	
Issuer	The distinguished name of the platform endorsement entity. 9.5.5 Instantiation of TPM_IDENTITY_CREDENTIAL

Startiofinformative comment

THRM identity certificate is an instantiation of a TRM IDENTITY GREDENTIAL

Accessio ine TRMEdentity certificate mustroetresmoted to entites that have at need to know. This is to reasons of privacy

rhis de inition/assumesthat rPMidenthy keys are 2048614RSA keys

End of informative comments are a second

If the data structure <TPM identity certificate> is stored on a platform after an Owner has taken ownership of that platform, it SHALL exist only in storage to which access is controlled and is available to authorized entities.

Overview

The TPM identity certificate represents an assertion by the Privacy CA that the referenced TPM identity is controlled by a TPM that conforms with the TPM specification. It contains a different public key to that contained in the TPM endorsement certificate, but it contains identifying and policy information transferred from the TPM endorsement, platform endorsement and platform conformance certificates.

Profile

Note:

- Some fields are assigned a value even though the certificate user performs no action with that
 value. In such cases, the intention is to inhibit non-TCPA implementations from making
 inappropriate use of the certificate.
- The policies identified in the TPM and platform certificates are represented by oids and are not
 distinguishable except by reference to the contents of the policies themselves. The verifier,
 however, must be able to distinguish between the different policy types.

In the case of the TPM identity certificate, the issuer is the Privacy CA and the user is an integrity verifier.

Field	Issuer action	User action		
Version	Assign value 2 (v3).	Check value = 2, else reject.		
Serial number	Assign a value unique amongst all certificates issued by "issuer".	No action.		
Signature	Assign algorithm identifier sha- 1WithRSAEncryption (1:2:840:113549:1:1:5).	Check the algorithm identifier = 1:2:840:113549:1:1:5, else reject. Validate the signature on the certificate using the public key of the Privacy CA (which should be a 2048-bit RSA key), obtained by an out-of-band means and referenced by "issuer" and "authority key identifier".		
Issuer	The distinguished name of the Privacy CA.	Check that the name is the name of an acceptable Privacy CA.		
Validity	Assign notBefore to the current time and notAfter to a later time (maybe the latest time permitted by the encoding scheme).	notBefore time, else reject.		
Subject	NULL.	No action.		
Subject public	Assign algorithm identifier sha-	Check algorithm identifier =		

key info	1WithRSAEncryption (1:2:840:113549:1:1:5). The 2048-bit RSA public key provided to the Privacy CA by the TPM owner in the identity request message.	1:2:840:113549:1:1:5, else reject. Use the public key in the integrity verification procedure.		
Issuer unique identifier	Omit.	No action.		
Subject unique identifier	Omit.	No action.		
Extensions				
Authority key identifier	Assign "critical" the value FALSE. Assign the value of "subject key identifier" from the Privacy CA's public-key certificate, if available, else omit.	The certificate user may use this value to locate the certificate that contains a public key of the Privacy CA with which the signature on this certificate can be verified.		
Subject key identifier	Omit.	No action.		
Key usage	May be omitted. If included, then the digital signature bit shall be set TRUE.	If present, then check that the digital signature bit is TRUE, else reject.		
Extended key usage	Omit.	If present and marked critical, then reject.		
Private key usage period	Omit.	If present, then check that the current time later than the notBefore time, else reject.		
Certificate policies	Assign "critical" the value TRUE. Assign policyldentifier at least one object identifier. Optionally, assign the cPSuri the value of an HTTP URL at which a plain language version of the Privacy CA's certificate policy may be obtained. Assign the explicit text userNotice policy qualifier the value "TCPA Trusted Platform Identity". Also, include the policylnformation values from the certificate policies extensions of the TPM endorsement and platform endorsement and conformance certificates provided in the TPM identity request message.	Check that at least one acceptable Privacy CA policyldentifier value is present. Optionally, check that at least one acceptable TPM endorsement, one acceptable platform endorsement and one acceptable platform conformance policyldentifier value are present.		
Policy mappings	Omit.	No action.		
Subject alternative name	Assign "critical" the value FALSE. Include three values in the extension:	Check that the manufacturer, model and version numbers of the TPM and of the platform are acceptable.		
name	The TPM manufacturer, model and version numbers from the TPM endorsement certificate "subject alternative name" extension provided in the TPM identity request message;			
	The platform manufacturer, model			

and version numbers from the platform endorsement certificate "subject alternative name" extension provided in the TPM identity request message; and

The TPM identity label provided to the Privacy CA by the TPM owner in the identity request message, encoded as a TPMIdLabel other-name. The TPM owner should choose a label syntax and semantics that are understood by the integrity verifier. (Note: the specified syntax accommodates multibyte character sets).

Issuer alternative name Omit.

No action.

Subject directory attributes

Assign "critical" the value FALSE. Include a multi-valued "supported algorithms" (see X.509) attribute containing object identifiers from the "subject directory attributes" extension of the TPM endorsement certificate and the "attributes" field of the platform endorsement certificate and the platform conformance certificate provided in the TPM identity request message.

Include the single-valued "TPM protection profile" attribute from the platform endorsement certificate provided in the TPM identity request message.

Include the single-valued "TPM security target" attribute from the platform endorsement certificate provided in the TPM identity request message.

Include the single-valued "Foundation protection profile" attribute from the platform endorsement certificate provided in the TPM identity request message.

Include the single-valued "Foundation security target" attribute from the platform endorsement certificate provided in the TPM identity request message.

Include the "security qualities" attribute from the TPM endorsement certificate provided in the TPM identity request message. (Note: this is the

Adapt the integrity verification protocol to use only algorithms supported by the TPM and the associated platform.

Check that the identifier is acceptable.

Optionally (and if present), check whether the TPM has acceptable security qualities.

	TPM distributed validation.)		
	Include the "security qualities" attribute from the platform endorsement certificate provided in the TPM identity request message. (Note: this is the platform distributed validation.)	Optionally (and if present), check whether the platform has acceptable security qualities.	
	Include the "tcpaVersion" attribute provided in the TPM identity request message.	Check that the TCPA specification version is acceptable, else reject.	
Basic constraints	Assign "critical" the value TRUE. Assign "CA" the value FALSE.	No action.	
Name constraints	Omit.	No action.	
Policy constraints	Omit.	No action.	
Inhibit any policy	Omit.	No action.	
CRL distribution points	Omit.	If present and marked critical, then reject.

arnerens novouarantee ordinteroperability when support for additional algorithms and in rotocols its provided. l≣ncloi/Informative comment

The algorithms and protocols in this specification are the REQUIRED algorithms and protocols. A TPM subsystem MAY support additional algorithms and protocols. When this specification specifies the use of the TSS for a feature, an implementation MAY place the feature in the TPM.

The interoperability requirements shall be implemented at the TSS layer not the TPM. It is the responsibility of the TPM manufacturer to produce a vendor specific byte stream generator. The TSS will provide a generic API that all applications for a specific platform (PC, PDA, etc) can use.

10.2 Conformance Specification Sheet

The TPM MUST support the base algorithms specified for each operation. The TPM MAY support additional algorithms and parameters.

The TPM manufacturer MUST include in the TPM credential all algorithms that the TPM supports.

The TSS manufacturer MUST include in the platform credential all algorithms that the TSS supports.

10.4 Cryptographic Algorithms and Protocols

Starteoriniormative comment:

The algorithms and protocols are the minimum that the TISS and TIPM must suppoint Additional algorithms and protocols are protocols are the TIPM and TISS. All algorithms and protocols available in the TIPM and TISS intestigations are protocols available in the TIPM and to allow a cardenial.

End of informative comment

10.4.1 Asymmetric

Start of informative comments

The asymmetric algorithm provides both algital signatures and wrapping of keys. The requirement of the TRM to support RSA allows the specification of operacorithms or both to trooses

iiPM devices that implement different algorithms may thave officent algorithms benform the algorithm and Walphing

IThere is no requirement concerning frow the IRS/A algoritam as to be amplemented. TPAM manufecturers may use (Shinese Remainder Theorem) (GRI) implementations of any other method. Designers should review PAS68 for guidance on IRSA implementations.

End of informative comment

- The TPM MUST support RSA.
- The TPM MUST use the RSA algorithm for encryption and digital signatures.
- The TPM MUST support key sizes of 512, 1024, and 2048 bits. The TPM MAY support other key sizes. The minimum RECOMMENDED key size is 1024 bits.
- The RSA public exponent MUST be e, where e = 2¹⁶+1.

TPM devices that use CRT as the RSA implementation MUST provide protection and detection of failures during the CRT process to avoid attacks on the private key.

The TPM MAY implement other asymmetric algorithms such as DSA or elliptic curve. These algorithms may be in use for wrapping, signatures, and other operations. There is no guarantee that these keys can migrate to other TPM devices or that other TPM devices will accept signatures from these additional algorithms.

All Storage keys MUST be of strength equivalent to a 2048 bits RSA key or greater. The TPM SHALL NOT load a Storage key whose strength less than that of a 2048 bits RSA key.

All TPM Identity keys MUST be of strength equivalent to a 2048 bits RSA key, or greater.

10.4.2 Symmetric

Start of Informative comment

The encryption done by the TRM does not acquire a symmetric algorithm. The TSS must provide the bulk encryption support. The assumption is the destination are provided the test has a conflict that the test has a conflict and more MIPS to accomplish this type of encryption.

there is novequirement that a TRM NOT support a symmetric algorithm. 在 TRM may implement a symmetric algorithm

The requirement to support both DES and SDES is because some localities have restrictions on the import or expert of SDES and the RSS should no thave an export or import imitation. DES is bould be in use only when the SDES is not allowable.

End of informative comment

The TSS MUST support 3DES. 3DES SHOULD be the symmetric algorithm of choice. The key size of 3DES MUST be 196 bits (three 64-bit keys). 3DES MUST be run in encrypt-decrypt-encrypt (EDE) mode. The TSS MUST provide detection of weak 3DES keys.

The TSS MUST support DES. The key size for DES MUST be 64 bits (56 bits plus parity). The TSS MUST provide detection of weak DES keys.

The TSS SHOULD have support for AES when it becomes available.

A TPM MUST support the storage of at least 256-bit symmetric keys.

10.4.3 Hashing

The TPM MUST support the SHA-1 hash algorithm as defined by FIPS-180-1. The output of SHA-1 is 160 bits and all areas that expect a hash value are REQUIRED to support the full 160 bits.

10.4.4 Signature Operations

The TPM MUST use the RSA algorithm for signature operations.

The TPM MAY use other asymmetric algorithms for signatures; however, there is no requirement that any other TPM device either accept or verify those signatures.

The TPM MUST use P1363 for the format and design of the signature output.

10.4.5 Creating a PCR composite hash

The definition specifies the operation necessary to create TCPA_COMPOSITE_HASH.

Action

The hashing MUST be done using the SHA-1 algorithm.

The input must be a valid TCPA_PCR_SELECTION structure.

The process creates a TCPA_PCR_COMPOSITE structure from the TCPA_PCR_SELECTION structure and the PCR values to be hashed. If constructed by the TPM the values MUST come from the current PCR registers indicated by the PCR indices in the TCPA_PCR_SELECTION structure.

The process then computes a SHA-1 digest of the TCPA_PCR_COMPOSITE structure.

The output is the SHA-1 digest just computed.

10.4.6 Creating TCPA_CHOSENID_HASH

This definition specifies the operation necessary to create a TCPA_CHOSENID_HASH structure.

Parameters

Туре	Name	Description
BYTE[]	identityLabel	The label chosen for a new TPM identity
TCPA_PUBKEY	privacyCA	The public key of a privacy CA chosen to attest to a new TPM identity

Action

The hashing MUST be done using the SHA-1 algorithm.

The process concatenates identityLabel and privacyCA (identityLabel followed by privacyCA) and computes a SHA-1 digest of the concatenated data.

The output is the SHA-1 digest just computed.

10.4.7 Using Secret Keys

informative comments:

Segretikeys cambelloaced into a TRM burpreferably are generated inside the JRM

MIRMigenerated key must not be used as a secretike yil in has already been exposed

Georgia (experioration) in properties and the control of the contr

End of informative comments ⋅ ⋅ ⋅ ⋅

A secret key is a key that is a private asymmetric key or a symmetric key.

Data SHOULD NOT be used as a secret key by a TCPA protected capability unless that data has been extant only in a shielded location.

A key generated by a TCPA protected capability SHALL NOT be used as a secret key unless that key has been extant only in a shielded location.

A secret key obtained by a TCPA protected capability from a Protected Storage blob SHALL be extant only in a shielded location.

10.5 Random Number Generator (RNG)

Start of informative comments

inherRendom (Number Ceneralor (RNC) is the sourceror randomness in the TPM Tine TPM tuses, thes pandom values formonces (keygeneration and randomness in signatures

The understanding is that this definition of the RNS, depending on implementation doublibe at Pseudo Rendom Number Generalor (PRNS). On those devices that theve a inardware source of entropy this implementation may be an RNS encerol at PRNS so there is no need for to keep track of which is which that is, the specification will always use RNS

Endlownformative.comment

The RNG for the TPM will consist of the following components:

- Entropy source and collector
- State register
- Mixing function

The RNG capability is a TPM-protected capability with no access control.

The RNG output may or may not be shielded data. When the data is for internal use by the TPM (e.g., asymmetric key generation) the data MUST be held in a shielded location. When the data is for use by the TSS or another external caller, the data is not shielded.

10.5.1 Entropy Source and Collector

Start of informative comment.

Tine entropy, source (is the process of processes that provide entropy. These types of sources could include noise clock variations all movement and other types of events.

The entropy collector is the process that collects the entropy. Tamoves bias, and smoothes the output the cliffence between the collector and the mixing strictles (described the section 10.6%. Whing fundion 1.4s that the collector may have specially ode to the addernance in stroving sinhedray entropy details for instance of the entropy source has collector realing 50 percent (send only dupercent 0s. then the realise of the entropy source has collectors sending the information to the state english.

Englosinformative.comment

The entropy source MUST provide entropy to the state register in a manner that provides entropy that is not visible to an outside process. For compliance purposes, the entropy source MAY be in the TSS and not the TPM; however, attention MUST be paid to the reporting mechanism.

The entropy source MUST provide the information only to the state register. The entropy source may provide information that has a bias, so the entropy collector must remove the bias before updating the state register. The bias removal could use the mixing function or a function specifically designed to handle the bias of the entropy source. The entropy source can be a single device (such as hardware noise) or a combination of events (such as disk timings). It is the responsibility of the entropy collector to update the state register whenever the collector has additional entropy.

10.5.2 State Register

Start of informative comment:

The state register implementation may use two registers a non-volatile register and a volatile register. The TPM loads the volatile register from the non-volatile register on startup. Each subsequent change to the state register from either the entropy source or the mixing function affects the volatile state register. The TPM saves the current value of the volatile state register to the non-volatile register on TPM power.

own. The TPM may update the ron-vorthe resister at any other time, the reasons for want it. Igasins are:

is in a complete the second complete the second complete the complete complete the complete complete the complete comple

land of informative comment

The state register is in a TPM-shielded location. The state register MUST be non-volatile. The update function to the state register is a TPM-protected capability. The primary input to the update function SHOULD be the entropy collector.

If the current value of the state register is unknown, calls made to the update function with known data MUST NOT result in the state register ending up in a state that an attacker could know. This requirement implies that the addition of known data MUST NOT result in a decrease in the entropy of the state register.

The TPM MUST NOT export the state register.

10.5.3 Mixing Function

នគាត់សម្រាស្រែកក្រសួន ១០៣៣១៧

The mixing rungion takes the state register and produces some output.

The mixing function is a TiPM-protected capability. The mixing function takes the state register and ceates the output of the ranks are treates the output of the ranks are the contemporary for the requirements for PRNC from FIPS (4/):

End of informative comment

Each use of the mixing function MUST affect the state register. This requirement is to affect the volatile register and does not need to affect the non-volatile state register.

10.5.4 RNG Reset

Standormative comments

The resulting of the RNS occurs of leasth response to a loss of power to the reputer

Three tests prove only that the RNC is still operating properly, they be not prove the virtual entropy is in the state register. This is why the self-test checks only site the local of threvious state and may begun beforethe soldlitor of more entropy.

Eneloginionnative comment

The RNG MUST NOT output any bits after a system reset until the following occurs:

- The entropy collector performs an update on the state register. This does not include the adding of the previous state but requires at least one bit of entropy.
- The mixing function performs a self-test. This self-test MUST occur after the loading of the previous state. It MAY occur before the entropy collector performs the first update.

10.6 Key Generation

Stantofiniornalivecomment:

ikey generation is algoritam specific. The requirements to a given algoritan comedicin the placeoling gealon or sections specific to it.

ithere are no liming requirements on the length of time that a 117% must mee when recombing they generation

and of informative commen

10.6.1 Asymmetric

The TPM MUST generate asymmetric key pairs. The generate function is a protected capability and the private key is held in a shielded location. The implementation of the generate function MUST be in accordance with P1363.

The prime-number testing for the RSA algorithm MUST use the definitions of P1363. If additional asymmetric algorithms are available, they MUST use the definitions from P1363 for the underlying basis of the asymmetric key (for example, elliptic curve fitting).

10.6.2 Symmetric

The TSS MUST generate a symmetric key by taking the next n bits from the TPM RNG.

The TSS SHOULD provide any processing of a symmetric key. Processing is an algorithm-specific operation and implementation is left to the designer.

10.6.3 Nonce Creation

The creation of all nonce values MUST use the next n bits from the TPM RNG.

10.7 Auditing

Sanodinomaliyacomient

The TRA and TSS must be able to depond be blievents. The logues thesame paradigm as the PCR. the TPA keeps are RVR value that extends for each logueven, and the TSS maintains the log entites to Challengers to review

ingventous nachaeteg litvistini knotisteos ankiseleknek enwolvistivatik

l≣noloidinioimativelcomment.

The TPM MUST be able to generate audit events for all TCPA protected capabilities.

The TPM Owner MUST be able to select the functions that will generate an audit event at any time.

The TPM MUST provide a PCR to store and log the audit events. The TPM MUST allow for the reporting of the current audit log PCR value. The value that the TPM adds to the TPM audit PCR MUST be the TCPA_AUDIT_EVENT structure.

The TSS MUST provide a log of all TPM-generated events. The TPM will generate the event and the TSS will fill in the event details. The TPM SHALL provide as much detail as it has available; however, the TSS MUST fill in all remaining details for the audit event. For instance, the audit event will require a data and time stamp on the event. There is no requirement for a clock function in the TPM, so the date and time would come normally from the TSS.

The TPM MAY generate audit events for other functions and activities not on this list.

10.8 Self-Tests

The TPM MUST provide startup self-tests. The TPM MUST provide mechanisms to allow the self-tests to be run on demand. The response from the self-tests is pass or fail.

The TPM MUST complete the startup self-tests in a manner and timeliness that allows the TPM to be of use to the BIOS during the collection of integrity metrics. The TPM MUST complete the required checks before a given feature is in use. This requirement allows the TPM to test the integrity metric storage and allow its use while simultaneously continuing to test the signature engine.

There are two sections of startup self-tests: required and recommended. The recommended tests are not a requirement due to timing constraints. The TPM manufacturer should perform as many tests as possible in the time constraints.

The TPM MUST report the tests that it performs.

The TPM MUST provide a mechanism to allow self-test to execute on request by any Challenger.

The TPM MUST provide for testing of some operations during each execution of the operation.

10.8.1 Required Self-Tests

The TPM MUST check the following:

- RNG functionality. This test follows FIPS 140-1, which checks the functioning of an RNG.
- Reading and extending the integrity registers. The self-test for the integrity registers will leave the
 integrity registers in a known state.
- Testing the endorsement key pair integrity, if they exist. This requirement specifies that the TPM will
 verify that the endorsement key pair can sign and verify a known value. This test also tests the RSA
 sign and verify engine. If an endorsement key has not yet been generated the TPM action is
 manufacturer specific.
- The integrity of the protected capabilities of the TPM. This means that the TPM must ensure that its "microcode" has not changed, and not that a test must be run on each function.
- Any tamper-resistance markers. The tests on the tamper-resistance or tamper-evident markers are under programmable control. There is no requirement to check tamper-evident tape or the status of epoxy surrounding the case.

10.8.2 Recommended Checks

The TPM SHOULD check the following:

- The hash functionality. This check will hash a known value and compare it to an expected result.
 There is no requirement to accept external data to perform the check. The TPM MAY support a test using external data.
- Any symmetric algorithms. This check will use known data with a random key to encrypt and decrypt the data.
- Any additional asymmetric algorithms. This check will use known data to encrypt and decrypt.
- The key-wrapping mechanism. The TPM should wrap and unwrap a key. The TPM MUST NOT use
 the endorsement key pair for this test.

10.8.3 Self-Test Failure

When the TPM detects a failure during any self-test, the part experiencing the failure MUST enter a shut-down mode. This shut-down mode will allow only the following operation to occur:

Update. The update function MAY replace invalid microcode, providing that the parts of the TPM that
provide update functionality have passed self-test.

All other operations will return the error code TCPA_FAILEDSELFTEST.

10.9 Object Reuse

The TPM MUST destroy and erase all temporal objects when the TPM finishes processing the object. The use of an object can be a long-term operation. For instance, the TPM could load an identity key and keep the key in memory while performing multiple challenge and response operations. There is no requirement to unload the object after each operation, but there is a requirement that the object be properly disposed of when all operations are complete.

When an internal TPM process uses objects, no information regarding the object may be available to outside processes. The TPM MUST enforce access control to all objects carrying sensitive information.

10.10 Maintenance

Sein o/linometivecommene

The maintarence feature is a vendor-specific lealure, and he implementation is version-specific. The Implementation must, however, meet the infilmum requirements as defined in section 7, 2, 6, so had one Implementation of the maintenance calure does not ground and child, he not a salar

There is no requirement that the maintenance teature be available; but it is implemented ather the requirements must be me.

The maintenance feature described in the specification is an example only, and not the lonly mechanism that a manufacture, could implement that meets these requirements

End of informative comments :

The maintenance feature MUST ensure that the information can be on only one TPM at a time. Maintenance MUST ensure that at no time the process will expose a shielded location. Maintenance MUST require the active participation of the Owner.

10.11 Backup

Sandantomative configure

ilne pupose of fordkopusto teksa kayane movefae endiner ilav. Ilne to oktomediamam must move only elgaletos internettos

The blockfathe bedkup eature oracles in the usable by any other TPM. This requirement holds only for keys and detailing are usable by all TPMs. For example, there is no requirement that at 76% on tag the way or example, there is no requirement that at 76% on tag the way or example, there is no requirement that at 76% on the tag, usable that it is not considered. The impation of information has a quarement only when the tag, usable of the required size.

End of Informative somments

The TPM MUST support the backup feature. The TPM MUST create a blob of migratable data that is readable by any other TPM. A receiving TPM MAY reject a backup blob if the underlying information is a non-standard size or algorithm.

10.12 Strength of Function

Start-of informative comment:

Tine common grifena defines is rengin of Evinction (SOE) as a qualification of a narget of Evaluation (IPOE security fundion expressing the minimum errors assumed necessary (to defeat his expected security behavior by directly attacking his underlying security medianisms.

Here are some definitions for the common SOF criteria

- ASOFebasio A level to tine in to e sof where analysis shows that the function provides adequate a protection against casual breach of HOE security by attackers possessing allow attack potential.
 - SOF medium. A level of the Tige SOF where analysis shows that the direction provides absorbate protection against straightforward or intentional breach of Fige security by altackers possessing a moderate atlack potentia
 - SOF-ingh. A level of the Tige SOF where analysis shows that the dinaton provides adequate or location against a deliberately, planned or locatived breach for TOE security by attackers possessing a high attack-potentia

Trace is no single overall COF definition ansterd received a period received with the COF should be affected to receive the COF should be affected to receive the COF of the Protection Profile will specify the SOF of the operation assument it is the SOF for the specific tenders and the SOF for the specific tenders and the SOF for the specific tenders. esistance will be SQE basic

The resting teb. Will determine it to specific sequitiviting of time and time protection in policy meets the SOF level. This specification will protespecify centificate this SOF as this metite is an exercitatelist value. That is, what was tright a few years ago is now not even at the basic texel. It is catally possible that a device that receives centification will postess give reharges thinks SOF centification for the finition

Endlockiniormative.comment

The TPM MUST report the SOF values to a Challenger and the SOF values MUST be part of the TPM endorsement certificate and the platform conformance certificate.

10.13 Physical Protection

Start of informative comment:

The main reason for inclusion of FIRS (4.0 is to specify the physical security requirements on a TRM. It a TRM to an another wishes to obtain full FIRS certification there are additional requirements that are not specifically include to PA documentation.

End of informative comment.

TPM MUST satisfy the FIPS 140-1 (or it's successor) level 2 physical security requirements, or it's equivalent.

End of informative comments.

10.16 Field Upgrade

Start of informative comment

A TPM; once in the field, may have need to update the protected capabilities. This command, which is obtional provides the mechanism to perform the update.

End of informative comment

The TPM SHOULD have provisions for upgrading the subsystem after shipment from the manufacturer. If provided the mechanism MUST follow the requirement from section 8.16.

10.17 Physical Presence or Access

Standondornative.comment:

This specification includes commands which require "local" or "physical" operance at the idiation in balone the command. Will repeate the intention is that these commands cannot be agrivated without authorization provided by directing ration with a person

If this be possible to control a TPM. Such controls include trose to clear an existing Owner from the IPM, temporarily descrivate a TPM are temporarily disable a TPM. Some such communes must won without conventional authorization information, because they will be required when the increasing authorization throughout the unavailable (because their is no Owner, on because the autiporzation throughout throughout the autiporzation throughout the supposition that such a supposition therefore the communicis are subject to denial or service; allegis, and recally require other althoughout the order.

Some commands are therefore prescribed to require physical presence (of a reson) at the clation before the command will operate. Such commands could be authorised with or by purely physical or electrical methods, or with or by purely physical presence detected using software when the platform is the restricted state. Such authorization is difficult or impossible to reproduce by requestivate depending or the exact methods of simplementation. The actual methods of implementation of such authorization is the chart methods of the manufacture. The overall strength of such authorization is reflected in the "security target" of the platform.

lina PC, such attinorization might be implemented using direct electrical connections from a switch of using software during the POSit

End of informative comment

The requirement for physical presence MUST be met by the platform manufacturer using some physical mechanism.

10.17.1 TSC_PhysicalPresence

Starttofainformativé comments

Some it My operations require an indication of an owners physical presence all the obtion. These are administrative operations that inceed to funding when the owners authoritication materials are not available. An indication of physical presence is an alternate method to appoin to whereing of the platform (Cenerally this is implemented using a barrivare stratigenested as a result of an owner's physical parawore stratigenested as a result of an owner's physical parawore stratigeness as the application of design of some stratign prevent this from being a cost of editor molementation.

Tills operation provides a method ig slacipation to powderproduction physical presence is highlic state of the pations and user adion. The pation thes the option to attach a herovers signaling in selection in the TRIV or use this command limite absence of it confunction with a herovers signal.

The values of the Physical reserve and Physical Preservation tiligs are preserved by TPM_SaveSets and TPM_Sambots vyer TGPA_ST_SPATE) to prevent changing the day will during of the pationals pover everences:

Note: Tipis operation does notalied tipe state of the findleallon of dual holes on ysteal please receiving may be the estate of the final deposition of the estate of the same hardware algual, deposition or timplementation.

While not a requirement, tiristikely the following filegs will be seaby the Platform manufacture dina single operation prioritism manufacture dina single operation prioritism proprietism in a line owner.

Incoming Operands and Sizes

PA	RAM	HN	IAC	Type	Type Name Description			
#	SZ	#	SZ	.5/2				
1	2			TCPA_TAG	tag	TPM_TAG_RQU_COMMAND		
2	4			UINT32	paramSize	Total number of input bytes including paramSize and tag		
3	4			TCPA_COMMAND_CODE	ordinal	Command ordinal, fixed value of TSC_ORD_PhysicalPresence.		
4	2			TCPA_PHYSICAL_ PRESENCE	physicalPresence	The state to set the TPM's Physical Presence flags.		

Outgoing Operands and Sizes

PARAM HMAC	· Tropa	Name	Description
# SZ # SZ	ype	TVLITTC .	Decalphan

1	2		TCPA_TAG	tag	TPM_TAG_RSP_COMMAND	
2	4		UINT32	paramSize	Total number of output bytes including paramSize and tag	
3	4		TCPA_RESULT	returnCode	The return code of the operation. See section 4.3 of Main Specification.	

Descriptions

This command must implemented in the TPM, however support for all of the bits is optional.

The operation sets the state of the physicalPresenceLifetimeLock, physicalPresenceHWEnable, and physicalPresenceCMDEnable flags to indicate how physical presence is to be indicated. It also sets the PhysicalPresence and PhysicalPresenceLock flags, if enabled, during operation of the Platform to indicate physical presence. This is a bit mask allowing a combination of flags to be set in a single operation.

Note: The TPM_PhysicalEnable requires unambiguous evidence of the presence of physical access. This is a higher level of proof than the other "physical presence" commands. A PhysicalPresence flag set to TRUE, SHALL NOT be sufficient proof to permit execution of TPM_PhysicalEnable unless it is impossible for software to subvert the TSC_PhysicalPresence command.

Actions

- 1. This operation MUST be implemented to process the values in the following order:
 - a. physicalPresenceHWEnable and physicalPresenceCMDEnable
 - b. physicalPresenceLifetimeLock
 - c. PhysicalPresence
 - d. PhysicalPresenceLock
- Once the PhysicalPresenceLock flag is set to TRUE, the TPM MUST not modify the PhysicalPresence flag until a TPM_Init followed by TPM_Startup(stType = TCPA_ST_CLEAR). Upon a TPM_Init and TPM_Startup(stType = TCPA_ST_STATE) the TPM MUST set the PhysicalPresenceLock flag to FALSE.
- 3. If the PhysicalPresenceLock flag is set to TRUE upon any call to this operation, the TPM MUST cause no action and MUST return the error TCPA_BAD_PARAMETER.

10.18 Other Specifications

Star common mative comment

There are other security spe<mark>difications and this section describes them and what level of compliance the</mark> IFOE/Armay have with steem

Reinbow Series. The Reinbow Series of specifications is being phases out by Protection Profiles Thereas no requirement that the FGPA be Orange Book compatible

INSEC, HISEC IS A European Sentero Hart is religionable found. Protection Profile: There is no Regulirement Hart TOPA use any INSEC socialisations

End-of informative comment

Individual manufacturers MAY do the additional design and testing to obtain a FIPS 140 certification, but there is no requirement that a TCPA device obtain this testing.

Specifications or standards included in this specification

- RFC 2104 (HMAC)

Appendix A: Glossary

3DES

DES using a key of a size that is 3X the size that of a DES key. See DES.

Blob

Opaque data of fixed or variable size. The meaning and interpretation of the data is outside the scope and context of the Subsystem.

Challenger

An entity that requests and has the ability to interpret integrity metrics from a Subsystem.

Conformance Credential

A credential that states the conformance to the TCPA specification of: the TPM; the method of incorporation of the TPM into the platform; the RTM; and the method of incorporation of the RTM into the platform.

Denial-of-service attack

A attack on a system (or subsystem) which has no affect on information except to prevent its use.

DES

Symmetric key encryption using a key size of 56 bits defined by NIST as FIPS 46-3. Reference http://csrc.ncsl.nist.gov/cryptval/des.htm.

Endorsement Credential

A credential containing a public key (the endorsement public key) that was generated by a genuine TPM.

Endorsement Key

A term used ambiguously, depending on context, to mean a pair of keys, or the public key of that pair, or the private key of that pair; an asymmetric key pair generated by a TPM that is used as proof that a TPM is a genuine TPM; the public endorsement key (PUBEK); the private endorsement key (PRIVEK).

Identity Credential

A credential issued by a Privacy CA that provides an identity for the TPM.

Integrity metric(s)

Values that are the results of measurements on the integrity of the platform.

Man-in-the-middle attack

An attack by an entity intercepting communications between two others without their knowledge and by intercepting that communication is able to obtain or modify the information between them.

Migratable

A key which may be transported outside the specific TPM.

Non-Migratable

A key which cannot be transported outside a specific TPM; a key that is (statistically) unique to a particular TPM.

Non-Volatile

Storage location or memory that retain their values after power-off or a TPM_Init function.

Owner

The entity that owns the platform in which a TPM is installed. Since there is, by definition, a one-to-one relationship between the TPM and the platform, the Owner is also the Owner of the TPM. The Owner of

the platform is not necessarily the "user" of the platform (e.g., in a corporation, the Owner of the platform might be the IT department while the user is an employee.) The Owner has administration rights over the TPM.

PKI Identity Protocol

The protocol used to insert anonymous identities into the TPM.

Platform Credential

A credential that states that a specific platform contains a genuine TCPA Subsystem.

POST

POST refers to the Power On Self Test performed by a PC.

Protection Profile

A document that defines all attacks and how they are resisted by the TPM, the RTM, and the methods by which they are incorporated into the platform.

Privacy CA

An entity that issues an Identity Credential for a TPM based on trust in the entities that vouch for the TPM via the Endorsement Credential, the Conformance Credential, and the Platform Credential.

Private Endorsement Key (PRIVEK)

The private key of the key pair that proves that a TPM is a genuine TPM. The PRIVEK is (statistically) unique to only one TPM.

Public Endorsement Key (PUBEK)

A public key that proves that a TPM is a genuine TPM. The PUBEK is (statistically) unique to only one TPM.

Random number generator (RNG)

A pseudo-random number generator that must be initialized with unpredictable data and provides, "random" numbers on demand.

Root of Trust for Measurement (RTM)

The point from which all trust in the measurement process is predicated. The RTM contains many components to provide this level of trust. The design document shows that the RTM includes a core component, the computing engine to run the core component, physical connections of the core and the computing engine and other items.

Root of Trust for Reporting (RTR)

The point from which all trust in reporting of measured information is predicated.

Root of Trust for Storing (RTS)

The point from which all trust in Protected Storage is predicated.

RSA

An (asymmetric) encryption method using two keys: a private key and a public key. Reference: http://www.rsa.com.

SHA-1

A NIST defined hashing algorithm producing a 160 bit result from an arbitrary sized source as specified in FIPS 180-1. Reference: http://csrc.ncsl.nist.gov/cryptval/shs.html.

Storage Root Key (SRK)

The root key of a hierarchy of keys associated with a TPM; generated within a TPM; a non-migratable key.

Subsystem

The combination of the TSS and the TPM.

Support Services (TSS)

Services to support the TPM but which do not need the protection of the TPM. The same as Trusted Platform Support Services.

Trusted Building Block (TBB)

A trusted Platform is instantiated as a Trusted Building Block (TBB) which is the evaluated component of a trusted system. The TBB is composed of the TPM, the Core RTM and the connection between them.

TCPA-protected capability

A function which is protected within the TPM, and has access to TPM secrets.

TPM Identity

One of the anonymous PKI identities belonging to a TPM; a TPM may have multiple identities.

TPM POST

TPM POST refers to the Power On Self Test performed by a TPM.

Trusted Platform Agent (TPA)

Trusted Platform Agent; the component within the platform that reports integrity metrics, logs, Validation Data, etc. to a Challenger; outside the scope of this specification.

Trusted Platform Measurement Store (TPMS)

Storage locations within the Subsystem, which contain unprotected logs of measurement process.

Trusted Platform Module (TPM)

The set of functions and data that are common to all types of platform, which must be trustworthy if the Subsystem is to be trustworthy; a logical definition in terms of protected capabilities and shielded locations.

Trusted Platform Support Services (TSS)

The set of functions and data that are common to all types of platform, which are not required to be trustworthy (and therefore do not need to be part of the TPM).

User

An entity that uses the platform in which a TPM is installed. The only rights that a User has over a TPM are the rights given to the User by the Owner. These rights are expressed in the form of authorization data, given by the Owner to the User, that permits access to entities protected by the TPM. The User of the platform is not necessarily the "owner" of the platform (e.g., in a corporation, the owner of the platform might be the IT department while the User is an employee). There can be multiple Users.

Validation Credential

A credential that states values of measurements that should be obtained when measuring a particular part of the platform when the part is functioning as expected.

Validation Data

Data inside a Validation Credential; the values that the integrity measurements should produce when the part of a platform described by the Validation Credential is working correctly.

Validation Entity

An entity that issues a Validation Certificate for a component; the manufacturer of that component; an agent of the manufacturer of that component.

Volatile

Storage locations or memory that are either set to a predefined value (e.g.,zero) or have values that are undefined upon completion of a power-on or TPM_Init function.

Appendix B: Key Usage Table

This table summarizes the types of keys associated with a given TPM command.
